1 SUMMARY OF PROJECT BENEFITS

The Marcondes Reducing Emissions from Deforestation and Forest Degradation (REDD+) Project is an AFOLU initiative focused on Avoided Planned Deforestation (APD), spanning a total area of 74,783 hectares of Amazon rainforest across 36 rural properties in the municipalities of Nhamundá, Parintins, and Barreirinha, State of Amazonas, Brazil. The project's core objective is to conserve approximately 14,957 hectares of dense ombrophilous forest that would otherwise be legally converted to cattle pasture under the Brazilian Forest Code (Law 12.651/2012). By the end of the 40-year crediting period, an estimated 10,008,517.90 tCO₂e of net GHG emission reductions will be achieved.

This project is developed in alignment with the Climate, Community, and Biodiversity (CCB) Standards v3.1, ensuring measurable benefits across three critical areas. From a climate perspective, the conservation of 74,783 hectares of standing forest maintains critical carbon stocks (668.42 tCO₂e/ha) and preserves the hydrological functions of the Nhamundá River basin, a clearwater tributary draining the southern Guiana Shield.

For local communities, the project delivers transformative benefits to the Comunidade Tradicional São Tomé do Mocambo do Arari (~80 families, Parintins) through a formal Benefit-Sharing Plan encompassing direct monetary benefits (participation in carbon credit revenue), community infrastructure (sanitation, energy, communication), training and capacity building, participatory forest monitoring with paid community guards, and cultural heritage support for traditional artisanal ceramics. The 40%/60% benefit-sharing structure ensures 60% of carbon revenues flow directly to the 36 participating landowners.

The project prioritizes biodiversity conservation within the Uatumã–Trombetas Moist Forests ecoregion, harboring at least 10 globally threatened mammal species (including *Inia geoffrensis* – EN, *Pteronura brasiliensis* – EN, *Tapirus terrestris* – VU), 250+ bird species, 300+ fish species (including endemic taxa in the Nhamundá River), and threatened tree species (*Swietenia macrophylla* – VU, *Bertholletia excelsa* – VU). Forest conservation preserves ecosystem functions including nutrient cycling, carbon sequestration, watershed protection, and ecological connectivity.

1.1 Unique Project Benefits

Outcome or impact estimated by the end of project lifetime	Section reference
1) Avoiding the emission of 10,008,517.90 tCO ₂ e of GHG, contributing to climate change mitigation over a 40-year period.	2.1.13 & 3

2) Improved livelihoods for ~80 families of the Comunidade Tradicional São Tomé do Mocambo do Arari through benefit-sharing, infrastructure, training, and participatory monitoring employment.	4.2
3) Conservation of 74,783 ha of dense ombrophilous forest maintaining habitat for 10+ globally threatened species and 300+ fish species in the Nhamundá River system.	5.2
4) Strengthening of traditional cultural practices (artisanal ceramics) and community governance through the Benefit-Sharing Plan.	4.2

1.2 Standardized Benefit Metrics

Category	Metric	Estimated by the end of project lifetime	Section reference
GHG emission reductions or carbon dioxide removals	Net estimated removals in the project area, measured against the without-project scenario	10,008,517.90 tCO ₂ e	2.1.13
	Net estimated reductions in the project area, measured against the without-project scenario	14,957 ha (APD area)	3.1.4
Forest ¹ cover	For REDD ² projects: Estimated number of hectares of reduced forest loss in the project area measured against the without-project scenario	74,783 ha	2.1.14
	For ARR ³ projects: Estimated number of hectares of forest cover increased in the project area measured against the without-project scenario	Not applicable	N/A
Improved land management	Number of hectares of existing production forest land in which IFM ⁴ practices are expected to occur as a result of project activities, measured against the without-project scenario	Not applicable	N/A
	Number of hectares of non-forest land in which improved land management practices are expected to occur as a result of project activities, measured	Not applicable	N/A

¹ Land with woody vegetation that meets an internationally accepted definition (e.g., UNFCCC, FAO, or IPCC) of what constitutes a forest, which includes threshold parameters, such as minimum forest area, tree height and level of crown cover, and may include mature, secondary, degraded and wetland forests (VCS Program Definitions)

² Reduced emissions from deforestation and forest degradation (REDD) - Activities that reduce GHG emissions by slowing or stopping conversion of forests to non-forest land and/or reduce the degradation of forest land where forest biomass is lost (VCS Program Definitions)

³ Afforestation, reforestation and revegetation (ARR) - Activities that increase carbon stocks in woody biomass (and in some cases soils) by establishing, increasing and/or restoring vegetative cover through the planting, sowing and/or human-assisted natural regeneration of woody vegetation (VCS Program Definitions)

⁴ Improved forest management (IFM) - Activities that change forest management practices and increase carbon stock on forest lands managed for wood products such as saw timber, pulpwood, and fuelwood (VCS Program Definitions)

	against the without-project scenario		
Training	Total number of community members who are expected to have improved skills and/or knowledge resulting from training provided as part of project activities	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
	Number of female community members who are expected to have improved skills and/or knowledge resulting from training as part of project activities	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
Employment	Total number of people expected to be employed in project activities ⁵ , expressed as number of full-time employees ⁶	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
	Number of women expected to be employed as a result of project activities, expressed as number of full-time employees	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
Livelihoods	Total number of people expected to have improved livelihoods ⁷ or income generated as a result of project activities	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
	Number of women expected to have improved livelihoods or income generated as a result of project activities	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
Health	Total number of people for whom health services are expected to improve as a result of project activities, measured against the without-project scenario	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1

⁵ Employed in project activities means people directly working on project activities in return for compensation (financial or otherwise), including employees, contracted workers, sub-contracted workers and community members that are paid to carry out project-related work.

⁶ Full time equivalency is calculated as the total number of hours worked (by full-time, part-time, temporary and/or seasonal staff) divided by the average number of hours worked in full-time jobs within the country, region or economic territory (adapted from the UN System of National Accounts (1993) paragraphs 17.14[15.102];[17.28])

⁷ Livelihoods are the capabilities, assets (including material and social resources) and activities required for a means of living (Krantz, Lasse, 2001. The Sustainable Livelihood Approach to Poverty Reduction. SIDA). Livelihood benefits may include benefits reported in the Employment metrics of this table.

	Number of women for whom health services are expected to improve as a result of project activities, measured against the without-project scenario	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
Education	Total number of people for whom access to, or quality of, education is expected to improve as result of project activities, measured against the without-project scenario	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
	Number of women and girls for whom access to, or quality of, education is expected to improve as result of project activities, measured against the without-project scenario	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
Water	Total number of people who are expected to experience increased water quality and/or improved access to drinking water as a result of project activities, measured against the without-project scenario	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
	Number of women who are expected to experience increased water quality and/or improved access to drinking water as a result of project activities, measured against the without-project scenario	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
Well-being	Total number of community members whose well-being ⁸ is expected to improve as a result of project activities	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1

⁸ Well-being is people's experience of the quality of their lives. Well-being benefits may include benefits reported in other metrics of this table (e.g. Training, Employment, Livelihoods, Health, Education and Water), and may also include other benefits such as strengthened legal rights to resources, increased food security, conservation of access to areas of cultural significance, etc.

	Number of women whose well-being is expected to improve as a result of project activities	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
Biodiversity conservation	Expected change in the number of hectares managed significantly better by the project for biodiversity conservation ⁹ , measured against the without-project scenario	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1
	Expected number of globally Critically Endangered or Endangered species ¹⁰ benefiting from reduced threats as a result of project activities ¹¹ , measured against the without-project scenario	Section not required for the Under Development stage in accordance with Section 3.1.6 of Registration and Issuance Process v5.0.	2.1.17 & 4.2.1

⁹ Managed for biodiversity conservation in this context means areas where specific management measures are being implemented as a part of project activities with an objective of enhancing biodiversity conservation, e.g. enhancing the status of endangered species

¹⁰ Per IUCN's Red List of Threatened Species

¹¹ In the absence of direct population or occupancy measures, measurement of reduced threats may be used as evidence of benefit

2 PROJECT DETAILS

2.1 Project Goals, Design and Long-Term Viability

2.1.1 Summary Description of the Project (VCS, 3.2, 3.6, 3.10, 3.11, 3.13, 3.14; CCB, G1.2)

The Marcondes REDD+ project is located in the municipalities of Nhamundá, Parintins, and Barreirinha, in the state of Amazonas, Brazil. The project area lies within the Middle Amazon basin, in the Nhamundá River watershed, a region of significant ecological value facing persistent deforestation pressures. According to Global Forest Watch (2020), Nhamundá municipality retains approximately 1.26 million hectares of natural forest, covering roughly 89% of its land area. Despite recent national progress, PRODES/INPE data shows Amazon deforestation declined by 50% cumulatively between 2022 and 2025, reaching 5,796 km² in the August 2024 – July 2025 period the state of Amazonas remains the second-largest contributor to absolute deforestation in the Legal Amazon, with 1,016 km² cleared in the most recent PRODES cycle. The main drivers of deforestation in the project region include legal land clearance for cattle ranching and agriculture, selective and illegal logging, and pressure from infrastructure development and land speculation along river corridors.

The Marcondes REDD+ project aims to avoid planned deforestation and degradation across a total project area of approximately 74,783 hectares (per GIS measurement, SIRGAS 2000 – EPSG 4674), comprising 36 rural properties (fazendas) held by approximately 24 landowners and entities. As an Avoided Planned Deforestation (APD) project under VM0007 v1.8, the project prevents the legally authorized conversion of 20% of each property's area (approximately 14,957 ha total APD area) from dense ombrophilous forest to cattle pasture. Under the baseline scenario, landowners would legally convert these forest areas to cattle pasture in accordance with the Brazilian Forest Code, resulting in significant carbon emissions from forest clearing and land-use change.

The project is located in the municipalities of Nhamundá (pop. 20,136, IBGE 2022; IDHM 0.586), Parintins (pop. 96,251), and Barreirinha, in the state of Amazonas, Brazil. The total estimated emission reductions and removals (ERRs) generated during the crediting period are 10,008,517.90 tCO₂e. The project crediting period spans 40 years, from 01 May 2023 to 30 April 2063. During this period, the average annual ERRs are estimated at 250,212.95 tCO₂e per year.

The project implements a comprehensive set of activities organized around four pillars: (1) Forest protection and monitoring, including satellite-based surveillance using Landsat, Sentinel-2 and Planet imagery, PRODES/DETER real-time deforestation alerts, drone-based photogrammetry and LiDAR surveys, and community-based patrols conducted in partnership with Comunidade São Tomé do Mocambo; (2) Sustainable livelihoods and bioeconomy, supporting the collection,

processing, and commercialization of non-timber forest products (NTFPs) including Brazil nuts (*Bertholletia excelsa*), açai (*Euterpe* spp.), copaíba oil (*Copaifera* spp.), and andiroba (*Carapa guianensis*), leveraging the project proponent's 20-year supply chain connecting Amazon communities to international markets; (3) Community infrastructure and well-being, encompassing solar energy systems, water capture and treatment, internet connectivity, and improvements to community facilities; and (4) Capacity building and environmental education, including training in sustainable forest management, organic and fair trade certification, fire prevention, and biodiversity monitoring techniques.

The project area is situated within the Amazon biome ecoregion of Uatumã–Trombetas Moist Forests (WWF classification), characterized by dense ombrophilous forest (terra firme), alluvial forests (várzea and igapó), and transitional vegetation zones. The region supports significant biodiversity, including species classified as Vulnerable, Endangered, or Critically Endangered by the IUCN, such as *Harpia harpyja* (Harpy Eagle, VU), *Pteronura brasiliensis* (Giant Otter, EN), *Priodontes maximus* (Giant Armadillo, VU), and *Bertholletia excelsa* (Brazil Nut, VU). By maintaining forest cover across the 36 properties, the project ensures the continuity of vital ecosystem services including carbon sequestration, watershed regulation, nutrient cycling, and habitat connectivity within a contiguous forest block.

Monitoring is carried out through an integrated system combining remote sensing (satellite imagery at multiple resolutions, drone surveys, FIRMS fire alerts), ground-based verification (permanent forest inventory plots, biodiversity transects, camera traps), and community-based surveillance (monthly patrols, fire detection and response). This multi-layered approach ensures early detection of threats and supports adaptive management.

Climate Objectives:

Avoid planned deforestation across the APD area of approximately 14,95 hectares, preventing the release of 10,008,517.90 tCO₂e over the 40-year crediting period (May 2023 – April 2063), representing an average estimated emission reductions of approximately 250,212.95 tCO₂e per year.

Community Objectives:

Improve livelihoods of riverine communities within the project zone through sustainable economic alternatives based on NTFP value chains, community infrastructure investments (solar energy, water systems, connectivity), capacity building, and equitable benefit-sharing of carbon credit revenues.

Biodiversity Objectives:

Protect habitat for threatened species and maintain ecological connectivity within the Amazon biome by preventing fragmentation, preserving High Conservation Value (HCV) areas, and implementing a comprehensive biodiversity monitoring program. The project is not located within a jurisdiction covered by a jurisdictional REDD+ program.

2.1.2 Audit History (VCS, 4.1)

Audit type	Period	Program	Validation/verification body name	Number of years
Validation/verification	(DD-Month-YYYY–DD-Month-YYYY)	VCS CCB	Validation/verification body name	One year
				

2.1.3 Sectoral Scope and Project Type (VCS, 3.2)

Sectoral scope	14: Agriculture, forestry, and other land use
AFOLU project category ¹²	Reduced Emissions from Deforestation and Degradation (REDD)
Project activity type	Avoiding Planned Deforestation (APD)

2.1.4 Project Eligibility (VCS, 3.1, 3.6, 3.8, 3.18, 4.1; CCB Program Rules, 4.2.4, 4.6.4)

The project is eligible under the VCS Program REDD activity category of avoiding planned deforestation as per Appendix 1 of the VCS standard v5.0. The project area qualifies as forest and has remained forested for more than 10 years prior to the project start date, meeting the applicable forest definition thresholds. In the absence of the project, the area was legally authorized and documented for conversion to non-forest land, which would have resulted in significant loss of forest carbon stocks. The project activities prevent this planned conversion by maintaining the forest cover and protecting existing carbon stocks, thereby reducing net GHG emissions associated with deforestation.

General Requirements

General eligibility of the project as per Section 3.1 of the VCS Standard v5.0:

General Eligibility as per VCS Standard v5.0	Justification
3.1.1 Projects shall meet all applicable VCS Program rules.	The project meets all applicable rules and requirements set out under the VCS Program, as detailed in this section and in Applicability of Methodology.
3.1.2 Project proponents shall apply methodologies listed on the Verra website.	The project applies the approved methodology VM0007 REDD+ Methodology Framework v1.8, which is currently active and listed on the Verra website.

¹² See Appendix 1 of the VCS Standard

3.1.3 Modules and tools shall be applied in accordance with the VCS Program rules and the applied methodology.	Modules and tools have been applied in accordance with the requirements of the VM0007 REDD+ Methodology Framework v1.8 and consistent with the rules of the VCS Program. Details of the modules and tools applied are provided in Section 3.1.1.
3.1.4 The version of a methodology, module, or tool that is applied shall be active on the date that the respective project request is submitted to Verra for the following types of requests: 1) Registration 2) Verification approval where the verification includes: a) baseline reassessment and/or b) a methodology change through a project description deviation 3) Crediting period renewal 4) Requantification	At the time of submission of the project for listing to Verra, the applied methodology VM0007 REDD+ Methodology Framework v1.8 and any associated modules and tools are active on the Verra website. The project proponent will ensure that the versions applied remain valid at the time of registration and will incorporate any updates or changes to the methodology, modules, or tools in accordance with VCS Program requirements, if applicable.
3.1.5 The project proponent may continue to apply the versions described in Section 3.1.4 for the remainder of the project crediting period or baseline reassessment period, whichever is shorter, unless otherwise specified on the Verra website.	VM0007 REDD+ Methodology Framework v1.8 and any associated modules and tools will continue to be applied for the duration of the project crediting period or baseline reassessment period, whichever is shorter, unless otherwise specified on the Verra website.
3.1.6 Project proponents shall conduct themselves lawfully at all times and ensure that the project and implementation of project activities do not lead to the violation of any national, state or provincial, local or municipal, or any other applicable law, regardless of whether the law is enforced. Where laws conflict, the more restrictive requirement shall prevail.	The project activities are implemented in compliance with all applicable national, state, provincial, and local laws and regulations as detailed in Section 2.5. In cases where multiple legal requirements apply and conflicts arise, the more restrictive requirement shall prevail to ensure full legal compliance throughout the implementation of the project activities.

3.1.7 Where a methodology permits the project proponent to choose a model: 1) the model shall conform to the VCS Methodology Requirements. 2) it shall be demonstrated at validation that the model is appropriate to the project circumstances and its use will lead to an appropriate quantification of reductions and/or removals.	Where the applied methodology VM0007 REDD+ Methodology Framework v1.8 allows the selection of a model, the selected model shall conform to the VCS Methodology Requirements. The appropriateness of the model for the project circumstances and its suitability for accurately quantifying GHG emission reductions will be demonstrated at validation.
3.1.8 Where a methodology permits the project proponent to choose a third-party default factor or standard to ascertain GHG emission data and any supporting data for establishing baseline scenarios and demonstrating additionality, the default factor or standard shall conform to the relevant requirements in the VCS Methodology Requirements.	Where the applied methodology VM0007 REDD+ Methodology Framework v1.8 permits the use of third-party default factors or standards to determine GHG emission data or supporting information for establishing the baseline scenario and demonstrating additionality, such factors will be sourced from recognized references such as the Intergovernmental Panel on Climate Change (IPCC) guidelines, peer-reviewed scientific literature, and other internationally accepted datasets. All selected default factors and standards shall conform to the relevant requirements specified in the VCS Methodology Requirements.
3.1.9 Implementing partners working with the project proponent shall be identified in the project description, including their roles and responsibilities over the project crediting period with respect to at least implementation, management, and monitoring of the project.	All implementing partners involved in the project are identified in Section 2.1.8, including their respective roles and responsibilities related to the implementation, management, and monitoring of project activities during the project crediting period. Detailed information will be provided during the validation stage in Section 2.4.
3.1.10 Project proponents shall demonstrate that during each verification period: 1) project activities have been implemented in accordance with the project design.	During each verification period, it will be demonstrated that the project activities have been implemented in accordance with the project design. Where no new project activities are implemented, evidence will confirm that previously implemented activities have

2) where no new project activities have been implemented, previously implemented project activities continued to be implemented.	continued. Any changes, if applicable, will be demonstrated and documented as project description deviations in accordance with Verra VCS Program requirements.
Project Crediting Period and Registration Timelines	
3.8.1 The initial crediting period start date shall: 1) be consistent with the definition of initial crediting period start date in the VCS Program Definitions. 2) conform to any criteria set out in the applied methodology. 3) be established based on implementation of the earliest project activity, where the project includes multiple project activities. 4) determine the start of the first project monitoring period, which shall begin on the initial crediting period start date. Some methodologies may require project proponents to quantify emissions that occur prior to this date to account for all project or baseline emissions.	The initial crediting period start date for the Marcondes REDD+ Project is 01 May 2023, which is consistent with the definition of the initial crediting period start date under the VCS Program and conforms to the criteria specified in the applied methodology. The project does not involve multiple project activities and implements a single REDD+ activity in a grouped project design aimed at avoiding planned deforestation (APD). Accordingly, the crediting period start date is established based on the earliest implementation of project activities undertaken to prevent planned deforestation. The selected date corresponds to the commencement of project implementation activities, including the execution of carbon credit agreements with participating landowners and the initiation of monitoring activities across properties located in the municipalities of Nhamundá, Parintins, and Barreirinha in the state of Amazonas. This date also determines the start of the first monitoring period, from which emission reductions are accounted for under the project. The applied methodology does not require quantification of emissions occurring prior to the crediting period start date; therefore, this provision is not applicable to the project. Further details on the project start date and commencement of implementation are provided in Section 2.1.10 of the PD.
Listing and Registration Deadlines	

3.8.2 Project proponents shall submit a pipeline listing request within one year of the initial crediting period start date.	The requirement under section 3.8.2 of the VCS Standard v5.0 requires project proponents to submit a pipeline listing request within one year of the initial crediting period start date. However, as clarified in the document “VCS Version 5: Overview of VCS Program Updates and Effective Dates” released by Verra on 16 December 2025, this requirement is only effective for pipeline listing requests submitted on or after 1 January 2027. Therefore, this requirement is not applicable to the present project, and the project remains eligible for pipeline listing even though the submission occurs more than one year after the initial crediting period start date.
3.8.3 Project proponents shall submit an initial registration request within the timelines set out in Table 7 in the VCS Standard v5.0	As per Table 7 in the VCS Standard v5.0, AFOLU projects are required to submit the registration request within eight years from the start of the initial crediting period. The present project complies with this requirement, as the registration request will be submitted within the applicable timeline from the initial crediting period start date.
Project Crediting Period Length	
3.8.4 The project crediting period shall be determined as set out in Table 8 in the VCS Standard v5.0	The crediting period for the present project is 40 years, spanning 01 May 2023 to 30 April 2063.
3.8.5 Proponents of AFOLU projects shall have a credible and robust plan for managing and implementing the project over the project crediting period, including for monitoring and verifying the project’s performance. Where the project crediting period is less than 40 years, the permanence of the project’s carbon stocks shall be monitored in accordance with the requirements in Sections 3.2.25–3.2.26.	The present project has established a comprehensive project implementation and management plan that includes institutional arrangements, monitoring procedures, and verification provisions to ensure effective implementation throughout the crediting period. The project has a crediting period of 40 years (01 May 2023 to 30 April 2063). Since the crediting period is 40 years, the requirement related to additional permanence monitoring for projects with a crediting period of less than 40 years, as referenced in

Sections 3.2.25–3.2.26, is not applicable to the present project. Therefore, the project complies with the requirement specified under section 3.8.5 of the VCS Standard v5.0.

2.1.5 Transfer Project Eligibility (VCS, 3.23, Appendix 2)

Not applicable. The Marcondes REDD+ project is not registered in another GHG program with activities included in the scope of the VCS program.

2.1.6 Project Design (VCS, 3.6)

Indicate if the project has been designed as:

- ☐ Single location or installation
- ☐ Multiple locations or project activity instances (but not a grouped project)
- ☒ Grouped project

2.1.6.1 Eligibility Criteria for Grouped Projects (VCS, 3.6; CCB, G1.14)

The Marcondes REDD+ Project is a grouped project with all the new project activity instances will follow the same requirements applied to the initial instances that will participate during validation, in accordance with Section 3.5.3 to 3.5.7 of the VCS Standard v5.0. As a grouped project, it also allows the inclusion of additional project activity instances in future years after the validation process, which currently covers only one instance.

VCS Standard Eligibility for Grouped Projects	Marcondes REDD+ Project
3.5.3 (1) Grouped projects shall specify one or more grouped project eligibility areas, which may be spatially distinct or overlapping.	The Marcondes REDD+ Project is implemented on properties located within the municipalities of Nhamundá, Parintins, and Barreirinha in the state of Amazonas, within the Amazon Biome. The Amazon Biome within the state of Amazonas constitutes the Grouped Project Eligibility Area for the project, within which future project instances may be included, subject to meeting the project eligibility criteria.
3.5.3 (2) Establish at least one initial project activity instance in each eligibility area.	As for validation, at least one initial project activity instance has been established within the grouped project eligibility area. The Marcondes REDD+ Project is currently implemented across 36 properties located within the municipalities of Nhamundá, Parintins, and Barreirinha in the state of Amazonas, within the Amazon Biome. These

	properties constitute the initial project activity instances established within the defined grouped project eligibility area.
3.5.3 (3) Determine the baseline scenario and demonstrate additionality separately for each eligibility area	The baseline scenario and demonstration of additionality have been determined separately for the grouped project eligibility area defined within the Amazon Biome located in the state of Amazonas. The analysis considers the prevailing land-use dynamics, drivers of deforestation, and regulatory context within the eligibility area to establish the most plausible baseline scenario and to demonstrate that the project activities implemented across the municipalities of Nhamundá, Parintins, and Barreirinha are additional to the baseline conditions.
3.5.4 The physical boundary of an eligibility area shall align with a jurisdiction or combination of jurisdictions and be within a single country.	The grouped project eligibility area for the proposed project is defined within the Amazon Biome located in the state of Amazonas, which lies entirely within Brazil. The project activities are currently implemented on properties located within the municipalities of Nhamundá, Parintins, and Barreirinha, which are administrative jurisdictions within the state of Amazonas. Therefore, the physical boundary of the eligibility area aligns with a combination of recognized administrative jurisdictions (municipalities) within the state of Amazonas and is entirely contained within the national boundary of Brazil. As such, the eligibility area complies with the requirement that the physical boundary aligns with a jurisdiction or combination of jurisdictions and is located within a same country.
3.5.5 The determination of baseline scenario and demonstration of additionality for an eligibility area shall: • be based on the initial project activity instances. • apply across the entire eligibility area.	The determination of the baseline scenario and demonstration of additionality for the eligibility area are based on the initial project activity instances implemented across 36 properties located within the municipalities of Nhamundá, Parintins, and Barreirinha in the state of Amazonas, within the Amazon Biome. The baseline scenario and additionality assessment are based on the prevailing deforestation drivers, land-use practices, and regulatory conditions observed within the initial project activity instances, supported by proxy area analysis to ensure

	representativeness across the eligibility area. Since these conditions are representative of the broader forest areas within the defined eligibility area, the same baseline scenario and additionality justification are applied consistently across the entire eligibility area.
3.5.6 For each eligibility area, project proponents shall specify eligibility criteria for adding new project activity instances to the eligibility area.	The project defines one eligibility area, located within the Amazon Biome in the state of Amazonas. Eligibility criteria have been specified to ensure that any new project activity instances added to the grouped project are located within this defined eligibility area and meet the same baseline, additionality, and monitoring requirements as the initial project activity instances implemented across properties in the municipalities of Nhamundá, Parintins, and Barreirinha.
3.5.7 Eligibility criteria shall ensure that all instances added to an eligibility area: • are uniquely identifiable. • share the same baseline scenario as the initial instances, or where multiple project • activities are implemented in each instance, the same combination of baseline scenarios. • share the same conditions relevant to additionality as the initial instances. • implement the same technologies or measures as the initial instances. • meet all applicability conditions of the applied methodology.	The eligibility criteria defined for the single eligibility area within the Amazon Biome in the state of Amazonas ensure that all new project activity instances added to the grouped project are uniquely identifiable at the property level and are located within the defined eligibility area. All added instances must share the same baseline scenario and conditions relevant to additionality as the initial project activity instances implemented across properties in the municipalities of Nhamundá, Parintins, and Barreirinha. The added instances will implement the project activity measures as the initial instances and will comply with all applicability conditions of the applied methodology.
3.5.8 Where project proponents add new project activity instances, these shall be added to a project in one or more batches at verification.	Any new project activity instances added to the grouped project will be incorporated in batches at the time of verification, in accordance with the applicable requirements. These instances will be added within the defined eligibility area in the Amazon Biome in the state of Amazonas and will meet the established eligibility criteria before inclusion in the project.
3.5.9 Project proponents shall hold the right to operate and the right to reductions and removals	The PP has established agreements with participating landowners within the project area,

for each new instance in a batch, demonstrated in accordance with Section 3.6 of the VCS Standard v5.0.	granting the PP the right to implement the project activities and the right to the VCUs generated from the respective properties. Through these agreements, the PP holds full control over the VCUs generated from each project activity instance, while a defined proportion of the benefits from the sale of VCUs will be shared with the participating landowners. Accordingly, the PP will demonstrate the right to operate and the right to VCUs for each new instance added in future, in accordance with Section 3.6 of the VCS Standard v5.0.
3.5.10 All instances within a batch shall: • be within a single eligibility area. • conform to the eligibility criteria established for the eligibility area. • have been implemented during the monitoring period being verified. • only be eligible for crediting up to the end of the project crediting period. • never have been enrolled in another project registered with the VCS Program, unless authorized by Verra.	All new project activity instances added in a batch will be located within the single defined eligibility area in the Amazon Biome within the state of Amazonas. Each instance will conform to the eligibility criteria established for the eligibility area and will have been implemented during the monitoring period being verified. All instances included in a batch will be eligible for crediting only up to the end of the project crediting period and will be verified to ensure that they have not been previously enrolled in any other project registered under the VCS Program, unless otherwise authorized by Verra.
3.5.11 Where the addition of a new batch of project activity instances impacts the leakage assessment of the existing instances, activity-shifting, market, and ecological leakage shall be reassessed for the entire project area.	Where a new batch of project activity instances is added, the project proponent will assess whether the inclusion of these instances affects the existing leakage assessment. If any impact is identified, activity-shifting, market, and ecological leakage will be reassessed for the entire project area within the eligibility area located in the Amazon Biome in the state of Amazonas, in accordance with the applicable methodology requirements.

2.1.7 Project Proponent (VCS, 3.7; CCB, G1.1)

Organization name	Organica Consultoria LTDA
Contact person	Rémi Denecheau
Title	Chief Executive Officer

Address	Rua Barbosa de Freitas 1741, Sala 04, Aldeota, Fortaleza, CE 60170-021, Brazil
Telephone	+55 85 99106 3502
Email	admin@organica-consulting.com

2.1.8 Other Entities Involved in the Project

Organization name	Comunidade São Tomé do Mocambo
Role in the project	Community partner — liaison with local populations, FPIC facilitation, community-based monitoring and patrols, stakeholder engagement
Contact person	To be confirmed
Title	Community representative
Address	R. Antônio Lopes, 10 — Mocambo, CEP 69157-899, Parintins, Amazonas, Brazil (Coordinates: -2.431562, -57.299312)
Telephone	Via Organica Consultoria: +55 85 99106 3502
Email	admin@organica-consulting.com

Organization name	Urupolpas Comércio de Produtos Alimentícios Ltda (CNPJ 44.749.580/0001-90)
Role in the project	Implementation partner for local operations, forest inventory, biodiversity surveys, FPIC consultations, and community relations
Contact person	Rémi Denecheau
Title	Administrator
Address	Estrada Governador Gilberto Mestrinho, Km 02, CEP 69.130-000, Urucará, Amazonas, Brazil
Telephone	+55 85 99431-7279
Email	contact@urupolpas.com

2.1.9 Project Ownership (VCS, 3.2, 3.7, 3.10; CCB, G5.8)

Legal Framework Governing Land Rights

Land ownership and tenure of the Marcondes REDD+ project properties are governed by applicable federal and state legislation in Brazil, which establishes the legal basis for possession, environmental registration, georeferenced boundary certification, and formal land tenure rights.

Federal Legislation

- Brazilian Civil Code (Law No. 10.406/2002, Articles 1.196–1.228): Recognizes possession (posse) as a protected right and establishes usucapião as a legal pathway to ownership.
- Brazilian Forest Code (Law No. 12.651/2012): Establishes the requirement for Cadastro Ambiental Rural (CAR) registration and mandates an 80% Legal Reserve for rural properties located in the Legal Amazon.
- Law No. 10.267/2001 and Decree No. 4.449/2002: Establish the SIGEF system (Sistema de Gestão Fundiária) and define requirements for georeferenced rural property registration.
- Law No. 6.015/1973 (Public Registries Law): Regulates property registration and the Matrícula system at the Cartório de Registro de Imóveis.

State Legislation (Amazonas)

- State Law No. 2.665/2001: Regulates state land policy, including the issuance of Concessão de Direito Real de Uso (CDRU) for state lands and terras devolutas.
- State Law No. 3.135/2007: Establishes the Amazonas State Policy on Climate Change, providing the legal framework for carbon credit projects and ecosystem services.

Land Ownership

The Marcondes REDD+ project is a grouped project and for validation comprises 36 rural properties located primarily in the municipality of Nhamundá, Parintins and Barreirinha, State of Amazonas, Brazil. The total project area is approximately 74,698 hectares, held by approximately 24 landowners and legal entities.

All 36 project properties are registered in the SIGEF system (Sistema de Gestão Fundiária) managed by INCRA, providing legally recognized, georeferenced, non-overlapping property boundaries. All properties are also registered in the Cadastro Ambiental Rural (CAR), which includes declared georeferenced boundaries, identification of Permanent Protection Areas (APPs), and demarcation of Legal Reserves in accordance with the 80% requirement applicable in the Legal Amazon. Applications for Concessão de Direito Real de Uso (CDRU) have been submitted to the SECT (Secretaria de Estado das Cidades e Territórios) for all properties, providing secure long-term rights of land use and management. Environmental license applications (Autorização de Supressão Vegetal – ASV) have been filed with IPAAM (Instituto de Proteção Ambiental do Amazonas) for all properties, confirming the legal authorization for land conversion that constitutes the basis for the APD baseline scenario.

Table 9. Overview of Applicable Land Regularization Pathway

Land Type	State lands (terras devolutas) and lands with occupation history
-----------	--

Issuing Authority	SECT – Secretaria de Estado das Cidades e Territórios
Prerequisite	SIGEF registration + CAR + Escritura de posse or equivalent
Titling Outcome	Concessão de Direito Real de Uso (CDRU)
Key Document	SIGEF certification (georeferenced boundaries)
Duration	CDRU grants long-term use rights compatible with project longevity

Carbon Credit Agreements

All 36 project properties are covered by carbon credit agreements between the respective landowners/possessors and the PP. Each agreement has a project duration of 40 years corresponding to the crediting period, with a longevity commitment of 100 years aligned with, Section 3.2.12 of VCS Standard v5.0.

Participants commit to maintaining forest cover within the APD area. The agreements grant the Project Proponent exclusive rights to claim, register, issue, and commercialize VCUs. They also provide access for monitoring, validation, verification, and audit purposes, and establish equitable benefit-sharing arrangements.

When an instance leaves the grouped project before the end of the project longevity, the provisions of Section 3.2.19 (1) or (2) of the VCS Standard v5.0 shall be followed.

Participating Parties

TOTAL		~24 owners/entities	3 mun.	~74,698	~74,698		

Note: All 36 properties are registered in SIGEF with georeferenced boundaries, registered in CAR, and have CDRU applications filed with SECT. Environmental license applications have been submitted to IPAAM for all properties.

Evidence of Right to Emission Reductions

The Project Proponent demonstrates the right to the GHG emission reductions through: (1) executed carbon credit agreements with all 36 participating landowners granting exclusive VCU rights; (2) documented chain of possession for each property; (3) active CDRU regularization proceedings; and (4) possession rights under Brazilian Civil Code, Articles 1.196–1.228.

2.1.10 Project Start Date (VCS, 3.8)

Project start date	01st May 2023
Justification	The start date of 01 May 2023 corresponds to the commencement of project implementation activities, including the execution of the initial carbon credit agreements with participating landowners, the initiation of remote sensing monitoring over the project area, and the first field tasks to establish baseline conditions. In Brazil, it is common practice for landowners to initiate deforestation prior to the issuance of a formal vegetation suppression licence where such practice is established at the regional level. In the municipality of Nhamundá, the Instituto de Proteção Ambiental do Amazonas (IPAAM) has authority to issue vegetation suppression authorizations (Autorização de Supressão Vegetal – ASV) for areas above 20 hectares, while smaller areas may be processed at the municipal level. The project intervened to prevent legally authorized deforestation by establishing conservation agreements with landowners and initiating monitoring and patrol activities from the project start date.

	Evidence of project implementation, including executed carbon credit agreements, field mission reports, and satellite monitoring records, will be made available to the VVB for review.

2.1.14 Physical Parameters (CCB, G1.3)

The project area is characterized by the following physical parameters, based on regional data from INPE, IBGE, CPRM, and INMET, supplemented by site-specific observations from field missions conducted since 2023.

General Location and Access

The Marcondes REDD+ project covers approximately 74,698 hectares across 36 rural properties primarily in the municipality of Nhamundá (14,107 km², Baixo Amazonas sub-region), with additional properties in Parintins (5,956 km²) and Barreirinha (5,752 km²). Nhamundá municipality borders Parintins and Urucará to the south, the state of Roraima to the north, and the municipalities of Faro and Terra Santa (State of Pará) to the east. Access is exclusively by waterway (via the Amazon and Nhamundá rivers from Parintins, approximately 577 km from Manaus by river) or by small aircraft using the Nhamundá airstrip. Elevation ranges from approximately 15 m (floodplain areas along the Amazon) to 150 m above sea level in the terra firme uplands within the project area.

Figure: General Location of the Project

Geology, Geomorphology and Topography

The project area is situated within the Amazon Sedimentary Basin, underlain by Cretaceous and Tertiary sedimentary formations. The predominant geological unit is the Alter do Chão Formation (Cretaceous–Paleogene), composed of sandstones, siltstones, and claystones, typical of the central Amazon lowlands. Geomorphologically, the landscape comprises dissected tertiary plateaus (terra firme), fluvial terraces, and extensive floodplain systems (várzea) along the Amazon and Nhamundá rivers. Topography is gently undulating to flat, with elevations generally between 30 m and 120 m in the terra firme zones. The Nhamundá River, which forms the boundary between the states of Amazonas and Pará, has a sandy bed and clear waters, with several rapids in its upper course and lake formations at the confluence with the Paracatu River.

Figure: Topography of the Marcondesq REDD+ Project area based on Digital Elevation Model (DEM) data.

Figure: Terrain slope distribution within the Marcondesq REDD+ Project area based on DEM data.

Climate

The climate is classified as Equatorial Humid (Af in the Köppen system), controlled by the Intertropical Convergence Zone (ITCZ) and equatorial continental air masses. Mean annual temperature is 26.3°C, with minimal seasonal variation (range: 24°C to 34°C). Annual precipitation ranges from 2,000 to 2,500 mm, distributed across two distinct seasons: the rainy season (December to May, with peak rainfall in March–April) and the dry season (June to November, with minimum rainfall in September–October). Relative humidity averages 80–90% throughout the year. The region occasionally experiences 'friagem' events (cold fronts from the south) that can temporarily reduce temperatures by 5–8°C.

Hydrology

The project area lies within the drainage basin of the Amazon River (right bank) and the Nhamundá River system. The Nhamundá River, a clear-water river originating in the highlands of Roraima, flows southward forming the natural boundary between the states of Amazonas and Pará before joining the Amazon. Its watershed encompasses a significant portion of the project properties. The hydrological regime is strongly seasonal, with annual flooding of the várzea areas between February and June (peak in May–June) and low-water levels from September to November. Water bodies within the project zone include the Amazon River main channel, the Nhamundá River and its tributaries, numerous igarapés (small forest streams), and seasonal and permanent lakes (lagos de várzea). These water systems are critical for local communities, supporting fishing, transportation, and domestic water supply.

Figure: River and drainage network within the Marcondes REDD+ Project area.

Soils (Pedology)

Soils in the project area are predominantly Dystrophic Yellow Latosols (Oxisols) in the terra firme zones, characterized by deep, well-drained profiles with low natural fertility, high aluminum saturation, and acidic pH (4.0–5.5). In the várzea zones, Gleysols and Fluviic Neosols predominate, with higher fertility due to annual sediment deposition from the Amazon River. Podzols (Spodosols) occur in localized areas of white-sand formations (campinarana). The low natural fertility of terra firme soils is a key factor limiting agricultural productivity and reinforcing the economic incentive for forest conversion to extensive cattle pasture the principal deforestation driver in the project region.

Figure: Soil map of the Marcondes REDD+ Project area showing the spatial distribution of soil types across individual project properties.

Vegetation and Land Cover

The project area is covered predominantly by Dense Ombrophilous Forest (Floresta Ombrófila Densa) in the terra firme zones, with Alluvial Ombrophilous Forest (várzea and igapó) along the river corridors. According to Global Forest Watch (2020), Nhamundá municipality retains approximately 1.26 million hectares of natural forest, covering roughly 89% of its land area. The vegetation types present include: (a) terra firme forest the dominant formation, with canopy heights of 25–35 m and emergents reaching 45 m, high species diversity (>200 tree species per hectare), and high above-ground biomass (estimated 150–300 t C/ha); (b) várzea forest seasonally flooded alluvial forest along the Amazon and Nhamundá rivers, with lower canopy (15–25 m) and adapted species; (c) igapó forest permanently or semi-permanently flooded blackwater forest; and (d) campinarana localized low-stature vegetation on white-sand soils. Non-

forest land cover within the project zone is minimal, limited to small-scale agricultural clearings, secondary vegetation (capoeira), and waterways.

Figure: Vegetation map showing the spatial distribution of vegetation types within the Marcondes REDD+ Project area.

Figure: Land Use and Land Cover (LULC) map of the Marcondes REDD+ Project area showing the spatial distribution of major land cover classes within the project boundaries.

Deforestation Dynamics

Deforestation in the Brazilian Legal Amazon reached 5,796 km² in the August 2024–July 2025 PRODES/INPE cycle, representing an 11.08% decrease from the prior period and the third-lowest rate since measurements began in 1988. This marks the third consecutive year of decline under the Lula administration, with a cumulative 50% reduction compared to 2022. The state of Amazonas specifically recorded a 16.93% reduction in deforestation (to approximately 1,000 km²). However, forest degradation has increased significantly 2,500,000+ hectares degraded in 2024, a 163% increase compared to 2022, primarily due to fire. Despite declining national rates, private landowners in the Baixo Amazonas sub-region continue to exercise their legal right to convert up to 20% of property area under the Forest Code (Law 12.651/2012). The Marcondes project addresses this ongoing baseline threat on 36 specific properties where deforestation authorization has been sought from IPAAM. Nhamundá municipality (14,107.5 km², pop. 20,136, IBGE 2022; pop. estimated 21,251 in 2025; IDHM 0.586) has 62 rural communities and limited economic alternatives to livestock, reinforcing the economic rationale for planned forest conversion.

2.1.15 Social Parameters (VCS, 3.18; CCB, G1.3)

Socioeconomic conditions in the three municipalities hosting project properties are characterized by low human development indices, dependence on subsistence agriculture and extractivism, limited public services, and geographic isolation typical of the interior Amazon.

Municipality Overview - Nhamundá

Nhamundá: Population 20,136 (IBGE Census 2022), estimated at 21,251 (2025). Area: 14,107 km². Density: 1.43 inhabitants/km². IDHM: 0.586 (PNUD/IBGE, 2010) — classified as low human development. PIB per capita: R\$11,905.57 (2023). School enrollment (6–14 years): 98.93%. Infant mortality: 13.25 per 1,000 live births (2023). The municipality has 57 identified communities, with the majority of the rural population (approximately 60%) living in dispersed riverine settlements along the Amazon and Nhamundá rivers. The economy is based on subsistence agriculture (manioc, rice, beans), fishing, livestock (small-scale), and extractivism (Brazil nuts, açai, timber). Indigenous peoples present in the municipality include the Waiwái, Hixkaryana, and Karafáwyna. Access to the municipal seat is by river only, from Parintins (approximately 8 hours by boat). Health infrastructure comprises basic public facilities only, with referral cases transferred to Parintins or Manaus.

Municipality Overview - Parintins

Parintins: Population 96,372 (IBGE Census 2022), estimated at 101,855 (2025). Area: 5,956 km². Density: 16.18 inhabitants/km². IDHM: 0.658 (PNUD/IBGE, 2010) classified as medium human development. PIB per capita: R\$17,193.26 (2023). Parintins is the regional center (Centro Sub-regional B) for the Baixo Amazonas region, serving as the commercial, educational, and healthcare hub for surrounding municipalities including Nhamundá and Barreirinha. The city is internationally known for the Festival Folclórico de Parintins (Boi-Bumbá Garantido vs. Caprichoso), a major cultural event. Two project properties (Mayara and André Marcondes IV) are located within Parintins municipality. Urban population share is approximately 68%.

Municipality Overview - Barreirinha

Barreirinha: Population 31,065 (IBGE Census 2022), estimated at 33,442 (2024). Area: 5,752 km². IDHM: 0.562 (PNUD/IBGE, 2010) classified as low human development. The municipality includes 14 districts and 170 communities, including indigenous territories of the Sateré-Mawé people and quilombola communities. One project property (Yod He Vav He, 11,234 ha the largest single property in the project) is located in Barreirinha municipality. The local economy is based on manioc flour production, fishing, guaraná cultivation (traditional Sateré-Mawé crop), and timber extraction.

Communities within the Project Zone

Communities within the project zone include Comunidade São Tomé do Mocambo (municipality of Parintins, coordinates -2.4316, -57.2993), which serves as the primary community partner, and dispersed riverine settlements along the Nhamundá River and its tributaries. These communities are characterized by subsistence livelihoods (fishing, manioc cultivation, NTFP collection), limited infrastructure (no electricity grid, river transport only), and low human development indicators. Nhamundá municipality has 62 rural communities (Prefeitura de Nhamundá 2025), a population density of 1.43 inhabitants/km² (IBGE 2022), and only 16.1% sewage coverage. The municipality's PIB per capita is R\$11,905.57 (IBGE 2023), and infant mortality stands at 13.25 per 1,000 live births (2023). Neighboring municipalities include Parintins (96,251 pop., IDHM 0.658), Barreirinha (IDHM 0.562), and Urucará. Detailed community enumeration and needs assessments will be completed during the baseline socioeconomic survey.

2.1.16 Project Zone Map and Project Location (VCS, 3.11, 3.18; CCB, G1.4-7, G1.13, CM1.2, B1.2)

The Marcondes REDD+ project aims to avoid planned deforestation and degradation across a total project area of approximately 74,783 hectares (per GIS measurement, SIRGAS 2000 – EPSG 4674), comprising 36 rural properties (fazendas) held by approximately 24 landowners and entities.

GIS-produced maps (see Appendix 9 – MARCONDES_LOCALIZAÇÃO.jpg, SIRGAS 2000 – EPSG 4674, Scale 1:300,000): (a) project boundary map with 36 property boundaries; (b) regional context map showing municipalities (Nhamundá, Parintins, Barreirinha) and state boundaries (Amazonas, Pará, Roraima); (c) property identification numbers.

Figure: Project Location

Figure: Zoomed-in view showing individual landholdings within the project area.

Additional maps to be produced: proxy area locations, vegetation classification, deforestation history (MapBiomas), and sample plot distribution.

- Project Zone Map: boundaries of 36 fazendas, municipality boundaries, project zone envelope
- Community Location Map
- APD Area Map within total project area
- HCV Areas Map
- Land Cover Map
- Reference Region Map

Geodetic coordinates: Central point approximately 2° 15'S, 57° 10'W. Bounding box: 56° 50'W to 57° 30'W, 2° 05'S to 2° 25'S. Reference system: SIRGAS 2000 – EPSG 4674. KML file to be submitted separately with the VCS registration package.

The project area is distributed across Nhamundá (31 parcels), Parintins (2 parcels: Mayara, André Marcondes IV), and Barreirinha (1 parcel: Yod He Vav He).

2.1.17 Project Activities and Theory of Change (VCS, 3.6; CCB, G1.8)

The project implements four main activities designed to prevent planned deforestation while generating measurable climate, community, and biodiversity benefits:

1. Forest Cover Maintenance and Monitoring

The project maintains the Avoided Planned Deforestation (APD) area approximately 14,940 hectares (20% of the total 74,698 ha project area) through continuous remote sensing (PRODES, DETER, and Planet imagery), drone surveillance, and ground patrols conducted in partnership with the Comunidade São Tomé do Mocambo. A monitoring protocol combining automated deforestation alerts with periodic field verification ensures early detection and response to any unauthorized clearing. Monitoring reports are produced quarterly and shared with landowners and community stakeholders.

2. Biodiversity Conservation and Research

Biodiversity is conserved through habitat protection across the full 74,698 ha project area, monitoring of sensitive and threatened species including Harpy Eagle (*Harpia harpyja*, VU), Giant Otter (*Pteronura brasiliensis*, EN), Giant Armadillo (*Priodontes maximus*, VU), and Brazil Nut Tree (*Bertholletia excelsa*, VU), and support for scientific research. The project maintains permanent biodiversity monitoring plots and conducts annual fauna and flora surveys in collaboration with research institutions. Camera traps, acoustic monitoring, and participatory species inventories with community members complement systematic transect surveys.

3. Community Infrastructure and Livelihood Development

The project enhances community well-being through targeted infrastructure investments and livelihood diversification programs. Specific interventions include: installation of solar energy systems for off-grid communities, provision of water filtration and treatment units, deployment of Starlink satellite internet systems for connectivity, and support for NTFP processing facilities (Brazil nut shelling, açai processing, copaiba oil extraction). The project also supports community-based agroforestry initiatives, fair-trade certification for NTFP products, and market access development to diversify income sources beyond subsistence agriculture.

4. Capacity Building and Training Programs

Training programs build skills in sustainable forest management, NTFP processing, fair trade, and renewable technologies, promoting gender and youth inclusion.

The project is implemented through coordinated roles: Organica Consultoria LTDA oversees coordination, carbon accounting, and monitoring. The Comunidade São Tomé do Mocambo provides community liaison, local monitoring support, and stakeholder engagement. Urupolpas Comércio de Produtos Alimentícios Ltda serves as the local implementation partner for field operations, forest inventories, FPIC processes, and community relations. The technical team project provides expertise in forest engineering, GIS analysis, biodiversity assessment, and socioeconomic evaluation.

The Theory of Change diagram will be developed as Appendix 2. The diagram illustrates causal pathways from project inputs (carbon finance from VCU sales, technical capacity from Organica Consultoria LTDA /Urupolpas, community partnerships with Mocambo) through activities (forest

conservation agreements with 36 landowners, monitoring and surveillance, community benefit programs, NTFP value chain development) to outputs (14,957 ha of avoided deforestation, employment creation, infrastructure improvements) and outcomes (231,138 tCO₂e/year avoided emissions, improved household incomes through 60% benefit-sharing, maintained ecosystem services, biodiversity conservation). Key assumptions include: continued VCU market demand, landowner compliance with conservation agreements, and political stability of Brazil's environmental regulatory framework. The Theory of Change will be finalized in the PD submission version with quantified indicators and a visual diagram.

2.1.18 Sustainable Development Contributions (VCS, 3.17)

The Marcondes REDD+ project contributes to the following United Nations Sustainable Development Goals (SDGs) and is aligned with Brazil's Nationally Determined Contribution (NDC) under the Paris Agreement:

- SDG 1 (No Poverty): Alternative income through benefit-sharing and NTFP value chains
- SDG 4 (Quality Education): Environmental education and training programs
- SDG 6 (Clean Water and Sanitation): Provision of water filtration and treatment systems to riverine communities within the project zone, improving access to safe drinking water.
- SDG 7 (Affordable and Clean Energy): Installation of solar photovoltaic systems and battery storage for off-grid communities, replacing diesel generators and reducing reliance on fossil fuels.
- SDG 8 (Decent Work): Local employment through monitoring, patrol, NTFP processing
- SDG 13 (Climate Action): Direct GHG emission reductions through avoided deforestation
- SDG 15 (Life on Land): Forest conservation and biodiversity protection

The project is aligned with Brazil's updated NDC (COP26), which commits to eliminating illegal deforestation by 2028 and achieving climate neutrality by 2050. The project also supports the objectives of the PPCDAm (Action Plan for Prevention and Control of Deforestation in the Legal Amazon) and the National REDD+ Strategy (ENREDD+). At the state level, the project contributes to the Amazonas State Climate Change Policy (Law No. 3.135/2007) and the State REDD+ System.

2.1.19 Implementation Schedule (CCB, G1.9)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.1.20 Risks to the Project (CCB, G1.10)

Table 15. Project Risks and Mitigation Measures

Identified Risk	Potential Impact	Mitigation Measures
Illegal logging and encroachment	Loss of forest cover, reduced emission reductions, habitat degradation	Remote sensing monitoring (PRODES/DETER), river and land patrols, coordination with IBAMA

Wildfire	Forest loss, carbon stock reduction, biodiversity damage	Fire prevention program, community brigades, satellite fire alerts (FIRMS)
Land tenure disputes	Project ownership challenges, legal uncertainty	Active CDRU regularization, legal support, SECT/INCRA engagement. 4 SECT-cancelled properties being resolved
Climate change impacts	Increased drought/fire risk, changes in forest composition	Adaptation measures (Section 3.4), forest health monitoring
Government policy changes	Regulatory changes affecting REDD+ or land tenure	Policy engagement, revenue diversification
Low carbon credit prices	Insufficient revenue for project activities	Offtaker agreements, NTFP diversification, cost optimization
Community non-participation	Loss of social license, stakeholder opposition	Continuous consultation via Comunidade São Tomé do Mocambo, transparent benefit-sharing, grievance mechanism
Loss of project instances	Reduction in area and emission reductions	40-year contracts + 100-year longevity, VCS Section 3.2.18, buffer pool

2.1.21 Benefit Permanence (CCB, G1.11)

In order to maintain and enhance the climate, social and biodiversity benefits, a set of actions organized in social and environmental programs will be carried out. Organica Consultoria LTDA and its investors have the necessary financial resources to maintain project activities until the first verification. Thereafter, revenues from carbon credit sales will sustain the project.

Climate:

Project activities aim to decrease deforestation and GHG emissions through systematic monitoring including river and land patrols and satellite surveillance. Maintenance of forest cover protects the watershed network and contributes to water regulation.

Communities:

Community residents will be protagonists in defining actions developed. Socio-environmental programs will reduce climate change impacts and improve quality of life in the communities of the project area, through access to renewable energy, clean water, connectivity, income diversification through NTFP value chains, and capacity building in sustainable forest management.

Biodiversity:

Fauna diagnosis and forest inventory have been initiated and will be expanded. Areas will be monitored with permanent plots for vegetation dynamics, and annual biodiversity assessments will track species populations and habitat integrity. Camera trap networks and acoustic monitoring stations will provide continuous data on key indicator species.

Permanence Mechanisms:

- 100-year longevity commitment in all carbon credit agreements
- VCS Standard v5.0, Section 3.2.19 provisions for instance exits
- AFOLU Non-Permanence Risk buffer pool
- Integration of sustainable economic activities (NTFP value chains, agroforestry) creating lasting conservation incentives

2.1.22 Financial Sustainability (CCB, G1.12)

Financing of project activities is guaranteed by funds committed by the project proponents from the project start date until the first verification.

The financing structure for the Marcondes REDD+ project is based on carbon credit revenues under the VCS Program, supplemented by initial investment from the project proponent:

The Project Proponent has secured project financing through carbon credit offtaker agreements that provide advance funding for project implementation. A portion of the forecasted carbon credits has been committed under forward purchase agreements, ensuring financial resources are available from the project start date through the first verification cycle. This pre-financing covers monitoring infrastructure, community program implementation, and project development costs.

Ongoing project financing is sustained through the sale of verified carbon credits (VCUs) on the voluntary carbon market, with revenues allocated according to the benefit-sharing structure defined in the carbon credit agreements with landowners. A portion of carbon credit revenues is dedicated to the community benefit fund, administered in consultation with the Comunidade São Tomé do Mocambo, ensuring long-term financial sustainability of community programs and biodiversity conservation activities.

2.2 Without-project Land Use Scenario and Additionality

2.2.1 Conditions Prior to Project Initiation and Land Use Scenarios without the Project (VCS, 3.13; CCB, G2.1)

The following scenarios represent the range of possible land-use outcomes in the absence of the Marcondes REDD+ project. These scenarios were developed based on analysis of regional land-use dynamics, landowner intentions, legal frameworks, and historical deforestation patterns in the municipalities of Nhamundá, Parintins, and Barreirinha, State of Amazonas, Brazil.

SCENARIO 1: Maintenance of forest cover (conservation without project)

Maintenance of the forest cover of 20% of the property, where land use conversion is allowed by law: the area is maintained without economic activities or conservation measures, but exposed to invasions and illegal deforestation, antecedents to livestock a common practice in the region. The landowner remains responsible for taxes to maintain ownership.

SCENARIO 2: Legal deforestation of 20% of the property (APD)

Legal deforestation of 20% of the property (deforestation with allowances), where land use conversion is allowed by law, i.e., forest suppression for pasture (livestock). Under the Brazilian Forest Code (Law No. 12.651/2012), rural properties in the Legal Amazon must maintain an 80% Legal Reserve, meaning up to 20% may be legally converted.

SCENARIO 3: Illegal deforestation exceeding 20%

Illegal deforestation of over 20% of the property (deforestation without a grant), where the conversion of land use exceeds the legal limit, driven by pasture expansion, agricultural purposes, or real estate speculation.

Evidence of deforestation drivers in the project area includes: (a) all 36 property owners hold environmental license applications (ASV) filed with IPAAM, demonstrating documented intent to clear the legally convertible 20% of their properties for pasture establishment; (b) PRODES/INPE and MapBiomas historical data show progressive deforestation on comparable private properties in the Nhamundá, Parintins, and Barreirinha municipalities; (c) the Nhamundá municipal economy is dominated by cattle ranching and subsistence agriculture (IBGE Municipal Agricultural Production data), with limited economic alternatives; (d) pasture land/agriculture land values exceed forest land values in the region, providing direct economic incentive for conversion; (e) road access improvements and population growth (4.82% increase from 2022 to 2024 per IBGE) are increasing pressure on forested lands.

2.2.2 Most-Likely Scenario Justification (CCB, G2.1)

The most likely scenario observed for the Marcondes project area is the conversion of land use and land cover from forest to livestock areas, legally (APD). Legal deforestation of 20% of the property (Scenario 2) is considered the most plausible baseline scenario because the land is expected to be converted to non-forest land and the conversion is legally authorized and documented, following VM0007 v1.8.

The identified deforestation agents are the landowners themselves, who have documented legal authorization to clear up to 20% of their property areas under the Forest Code (Law 12.651/2012). Evidence includes: (a) IPAAM environmental license applications (ASV) filed by all 36 property holders; (b) property registration in SIGEF demonstrating legal control of the land; (c) CAR (Cadastro Ambiental Rural) registration identifying the legal reserve and APD-eligible areas; (d) economic profile consistent with agricultural expansion the landowners include individual farmers, family groups (e.g., Fazenda AnaLina I/II/III, Fazenda Irmãos Marcondes, Fazenda André Marcondes IV/V), and corporate entities (FIEMU Corporation, Marcondes Q Corporation) whose primary economic activity is or would be cattle ranching.

2.2.3 Community and Biodiversity Additionality (CCB, G2.2)

In the absence of the Marcondes REDD+ project, neither the community benefits nor the biodiversity conservation outcomes would occur. The project area is located in a region of the

eastern Amazon where planned deforestation is legally permissible and widely practiced due to expanding pressures from cattle ranching, agriculture, timber extraction, and other land-use conversion activities.

Without the project, these drivers would continue to advance, resulting in large-scale forest loss, degradation of ecosystems, and a decline in ecosystem services that sustain local communities. No government program, private organization, or community initiative currently possesses the financial, technical, or institutional capacity to prevent this deforestation or to generate the significant social and environmental benefits that the project will deliver.

Although Brazilian environmental legislation primarily the Forest Code establishes requirements for Legal Reserves and Areas of Permanent Preservation, enforcement in remote Amazonian regions is limited. Environmental agencies such as IBAMA, ICMBio, and state-level authorities operate with insufficient personnel, financial resources, and field presence to monitor land-use change effectively. As a result, illegal deforestation persists, and legally authorized clearing continues unchecked.

The project activities would not occur without carbon finance due to substantial financial barriers. Local communities lack the investment capacity needed to install renewable energy systems, develop potable water infrastructure, or establish agro-industries for processing NTFPs. Landowners similarly lack resources to implement forest monitoring systems, engage professional biodiversity technicians, or conduct long-term conservation planning. No government or donor program is currently committed to filling these gaps.

Significant technological and knowledge barriers also prevent the implementation of sustainable development actions in the without-project scenario. Community members do not have access to the technical expertise required to manage NTFP value chains, apply sustainable harvesting techniques, conduct biodiversity monitoring, or maintain renewable energy systems.

2.2.4 Benefits to be used as Offsets (CCB, G2.2)

The community and biodiversity benefits are not intended to be used as offsets but are documented and monitored under the CCB Standard to demonstrate the project's net positive impacts on local communities and ecosystems.

2.3 Safeguards and Stakeholder Engagement

2.3.1 Stakeholder Identification (VCS, 3.18, 3.19; CCB G1.5)

The stakeholder identification process for the Marcondes REDD+ project was conducted using a structured, two-phase assessment, combining remote analysis and on-the-ground field validation. Stakeholders were identified based on their legal rights, forest resource dependence, potential influence on project outcomes, and possession of relevant local knowledge.

Phase 1 – Remote Stakeholder Identification

This phase consisted of a structured remote assessment aimed at identifying all stakeholders relevant to or potentially affected by the project. This phase relied on bibliographic reviews, targeted internet searches, and consultations with landowners and local intermediaries to establish an initial understanding of the social, environmental, and institutional landscape across the municipalities of Nhamundá, Parintins, and Barreirinha. Methodological guidance from VCS-CCB Standard, UN-REDD stakeholder engagement guidelines, and FAO REDD+ materials ensured systematic consideration of all required stakeholder categories.

Through this process, the following major stakeholder groups were identified:

- Project Proponent: Organica Consultoria LTDA
- Landowners/Possessors: The 24 landowners and entities holding the 36 project properties
- Community implementation partner: Comunidade São Tomé do Mocambo
- Public authorities: Prefeitura Municipal de Nhamundá, IPAAM, IDAM, SEMA, INPA, SECT, INCRA
- Local community beneficiaries: Comunidade São Tomé do Mocambo (Parintins), and dispersed riverine communities along the Nhamundá River and its tributaries within and adjacent to the project zone. Community names identified include those located within the 62 rural communities of Nhamundá municipality (Prefeitura de Nhamundá). Specific community enumeration and beneficiary registration will be completed during the baseline socioeconomic assessment and FPIC consultation process.

- Third sector: Agrofrut Cooperative (cooperative of rural producers in the Nhamundá region), Colônia de Pescadores de Nhamundá (local fishermen's association), community-based organizations in Comunidade São Tomé do Mocambo, and church-based community groups. Specific associations and their roles in project implementation will be confirmed and formalized during the stakeholder engagement process.

Figure: Discussion in loco in the project area — technical team and community members assessing forest cover and access roads (6 May 2025)

Figure: Field visit to the Marcondes REDD+ project area — Organica Consultoria team and community representatives. GPS: 2.4239°S / 57.3032°W (6 May 2025, 08:52)

Phase 2 — On-Site Field Engagement and Validation

Field visits and community engagement for the Marcondes REDD+ project have been conducted as follows:

1. November/December 2022 — Exploratory visit: First visit by the project team to the Comunidade São Tomé do Mocambo do Arari. Initial presentation of the REDD+ concept to community leaders, identification of community structure and representatives, and preliminary assessment of community interest and needs.
2. February 2023 — Formal presentation: Formal presentation of the Marcondes REDD+ project to the community association (Associação comunitária local). Detailed explanation of the REDD+ mechanism, voluntary carbon market, VCU generation process, and the role of VCS v4.4/CCB v3.0 certification standards.
3. April 2023 — Benefit-sharing negotiation: Presentation and negotiation of the Benefit-Sharing Plan (Plano de Repartição de Benefícios — PRB). Discussion of benefit categories: direct monetary benefits, community infrastructure, training and capacity building, participatory monitoring, and cultural heritage support.
4. 1 May 2023 — Official project start date: Formal launch of the Marcondes REDD+ project.

5. Second semester 2023 — Follow-up meeting: First semi-annual follow-up meeting with the community. Presentation of initial project results and satellite monitoring data.
6. First semester 2024 — Annual assembly 2024: Community general assembly with broad participation. Accountability report on project activities and benefit distribution.
7. Second semester 2024 — Monitoring meeting: Socio-environmental monitoring meeting. Participatory assessment of CCB co-benefits (climate, community, biodiversity).
8. 6 May 2025 — FPIC Principal Assembly: Main Free, Prior and Informed Consent assembly held at the community hall (salão comunitário) and Igreja de São Tomé. Comprehensive presentation of project status after 2 years of operation, review of benefit-sharing, formal consent resolution, photographic documentation. The assembly was attended by community members, project technical staff from Organica Consultoria LTDA, and community representatives. Field visit to the project area was conducted (coordinates: 2.4239°S / 57.3032°W).
9. April 2026 — Planned: Field visit and Annual Assembly 2026 with updated project information and continued consultation. Complete FPIC documentation with CLPI dossier included as Appendix.

It was confirmed that all land tenure and access rights within the project area are held by the 36 participating landowners and entities, as documented in the property inventory (Table 10) and carbon credit agreements. No legal or customary tenure or access rights held by communities have been identified that conflict with the project activities. Dispersed riverine communities along the Nhamundá River maintain traditional fishing and NTFP collection rights on waterways adjacent to but outside the project property boundaries, consistent with Brazilian law. These customary use rights are respected and unaffected by the project.

2.3.2 Stakeholder Descriptions (VCS, 3.18, 3.19; CCB, G1.6, G1.13)

Detailed descriptions of each stakeholder group, including their rights, interests, relevance to the project, and potential impacts, are provided in Appendix 1: Stakeholder Description Table.

Stakeholder descriptions:

(1) 24 landowner groups/entities controlling 36 properties — private landowners and corporate entities (FIEMU Corporation, Marcondes Q Corporation, family groups) with ASV applications filed with IPAAM.

(2) Comunidade Tradicional São Tomé do Mocambo do Arari — Traditional Ribeirinha community, approximately 80 families, located on Lago Mocambo (affluent of the Amazon River), municipality of Parintins, Amazonas (coordinates: -2.430479, -57.300309). The community is represented by a local community association. Economic activities: family agriculture, artisanal fishing, plant extractivism, artisanal ceramics. Community infrastructure: church (Igreja de São Tomé), community hall (salão comunitário), school, football field, water supply system. Access: fluvial via Amazon River / Lago Mocambo.

(3) Prefeitura de Nhamundá — municipal government.

(4) IPAAM – state environmental agency (ASV authorization, environmental licensing).

(5) IDAM – state agricultural extension (sustainable livelihood alternatives).

(6) INCRA – federal land regularization agency.

(7) Agrofrut Cooperative – rural producers cooperative in the Nhamundá region.

(8) Colônia de Pescadores de Nhamundá – local fishermen's association.

Detailed stakeholder descriptions are provided in the CLPI dossier (CLPI_Marcondes_Mocambo_v1.docx).

2.3.3 Stakeholder Access to Project Documents (VCS, 3.18, 3.19; CCB, G3.1)

The Project Proponent ensures that all relevant project documentation is accessible to stakeholders through multiple channels:

- The Project Description, monitoring reports, and validation/verification reports are made publicly available through the Verra Registry upon registration.
- Summary project documents in Portuguese are made available to communities through the Comunidade São Tomé do Mocambo and during stakeholder consultation meetings.
- Hard copies of key project documents are maintained at the project field office and at the Comunidade São Tomé do Mocambo for consultation by local stakeholders.
- Digital copies are available upon request to the Project Proponent via email (admin@organica-consulting.com) or telephone (+55 85 99106 3502).

All project documents intended for community distribution are translated into Portuguese and presented in accessible language appropriate for the educational level of local stakeholders. Where necessary, oral explanations are provided during community meetings.

2.3.4 Dissemination of Summary Project Documents (VCS, 3.18, 3.19; CCB, G3.1)

A summary of the Project Description Document, written in accessible Portuguese, is disseminated to all identified stakeholder communities prior to the public comment period and prior to validation. The summary includes a description of the project activities, expected climate, community and biodiversity benefits, the grievance mechanism, and information on how to participate in the public comment process.

Dissemination methods include: distribution during stakeholder meetings, posting at community notice boards, delivery through the Comunidade São Tomé do Mocambo network, and electronic distribution where internet access is available.

2.3.5 Informational Meetings with Stakeholders (VCS, 3.18, 3.19; CCB, G3.1)

The Project Proponent organizes informational meetings with stakeholders to present the project, explain its objectives and activities, and respond to questions and concerns. These meetings are held in Portuguese and conducted in culturally appropriate formats.

Informational meetings conducted for the Marcondes REDD+ project:

(1) November/December 2022 – Comunidade São Tomé do Mocambo do Arari: Exploratory visit. Topics: initial presentation of REDD+ concept, identification of community leaders and representatives, preliminary needs assessment.

(2) February 2023 – Comunidade São Tomé do Mocambo do Arari: Formal project presentation to the community association. Topics: REDD+ mechanism explanation, voluntary carbon market, VCU generation, VCS/CCB certification process, project timeline and activities.

(3) April 2023 – Comunidade São Tomé do Mocambo do Arari: Benefit-sharing negotiation meeting. Topics: Plano de Repartição de Benefícios (PRB) categories direct monetary benefits, infrastructure, training, participatory monitoring, cultural heritage support. Community priorities discussed.

(4) 2023–2024 – Semi-annual follow-up meetings with the community (S2 2023, S1 2024, S2 2024). Topics: project progress, monitoring results, benefit distribution status, co-benefit assessment.

(5) 6 May 2025 – FPIC Principal Assembly at Comunidade São Tomé do Mocambo do Arari. Topics: comprehensive project status after 2 years, REDD+ mechanism review, community rights (right to refuse, right to participate, right to grievance mechanism), benefit-sharing review, formal consent resolution. Photographic documentation included in CLPI dossier.

(6) Consultations with all 36 property holders were conducted individually and in groups in Nhamundá and Parintins. Topics: carbon credit agreement terms, 40%/60% benefit-sharing formula, conservation commitments, 100-year permanence clause, monitoring requirements. Meeting minutes (atas de reunião) are on file.

(7) Government authority consultations were held with Prefeitura de Nhamundá, IPAAM, and other relevant agencies. Topics: project registration, ASV status, environmental compliance, municipal coordination. Meeting dates to be detailed in the validation package.

2.3.6 Risks from the Project and No Net Harm (VCS, 3.18, 3.19)

The project has been designed to ensure no net harm to stakeholders. A risk assessment has been conducted to identify potential negative impacts of project activities on local communities, and mitigation measures have been developed for each identified risk.

The principal risk identified is that forest conservation activities may limit access to forest resources for communities that historically depend on them. This risk is mitigated through: (1) benefit-sharing mechanisms that provide alternative income; (2) continued access to NTFPs under sustainable harvesting plans; (3) community participation in project design and

implementation through the Comunidade São Tomé do Mocambo; and (4) the grievance mechanism.

Additional risks identified include: (a) potential conflicts with informal resource users (garimpeiros, illegal loggers) who may resist forest conservation measures mitigated through coordination with IBAMA and state environmental police; (b) political opposition from local authorities or economic actors who benefit from deforestation-driven development mitigated through transparent stakeholder engagement and documentation of project benefits; (c) extreme weather events (flooding, drought) affecting community infrastructure and project operations mitigated through adaptive management and climate-resilient infrastructure design.

2.3.7 Community Costs, Risks, and Benefits (CCB, G3.2)

The project has assessed potential costs, risks, and benefits to communities within the project zone:

Benefits:

- Direct income from benefit-sharing of carbon credit revenues
- Employment opportunities in monitoring, patrol, and NTFP processing
- Solar photovoltaic systems for off-grid energy access, water filtration and purification units, Starlink satellite internet connectivity, and NTFP processing equipment (Brazil nut shelling units, açaí processors, oil extraction presses)
- Capacity building and training programs
- Improved environmental quality and ecosystem services

Costs:

- Potential reduction in access to timber resources in conservation areas
- Time commitment for participation in consultations and monitoring activities

Risk Mitigation:

Costs are mitigated through benefit-sharing arrangements that compensate for any reduced resource access, and through the continued availability of NTFPs under sustainable management. The grievance mechanism provides a channel for addressing unforeseen negative impacts.

2.3.8 Information to Stakeholders on Validation and Verification Process (VCS, 3.18.6, 3.19; CCB, G3.3)

Stakeholders are informed about the validation and verification process through the following mechanisms:

- The public comment period (30 days) during which any stakeholder may submit comments through the Verra Registry.
- Informational meetings with communities explaining the validation process, the role of the validation/verification body (VVB), and opportunities to communicate directly with auditors.
- Written notice distributed through the Comunidade São Tomé do Mocambo network prior to the VVB site visit.
- Stakeholders are informed that they have the right to submit comments and that all comments received during the public comment period will be addressed in the validation report.

2.3.9 Site Visit Information and Opportunities to Communicate with Auditor (VCS, 3.18.6; CCB, G3.3)

The Project Proponent ensures that stakeholders are informed of upcoming VVB site visits and are provided with opportunities to communicate directly with the auditor. Specifically:

- Community leaders and the Comunidade São Tomé do Mocambo are notified at least 15 days in advance of any planned site visit by the VVB.
- The VVB is provided with a list of stakeholder contacts and community locations to facilitate direct engagement during the site visit.
- Stakeholder meetings with the VVB are organized in accessible locations within the project zone.
- Stakeholders may also communicate with the VVB through the Verra Registry public comment process.

2.3.10 Stakeholder Consultations (VCS, 3.18; CCB, G3.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.11 Continued Consultation and Adaptive Management (VCS, 3.18; CCB, G3.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.12 Stakeholder Consultation Channels (CCB, G3.5)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.13 Stakeholder Participation in Decision-Making and Implementation (VCS, 3.18, 3.19; CCB, G3.6)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.14 Anti-Discrimination Assurance (VCS 3.19; CCB, G3.7)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.15 Feedback and Grievance Redress Procedure (VCS, 3.18.4; CCB, G3.8)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.16 Accessibility of the Feedback and Grievance Redress Procedure (VCS, 3.19; CCB, G3.8)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.17 Worker Training (VCS, 3.19; CCB, G3.9)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.18 Community Employment Opportunities (VCS, 3.19.13; CCB, G3.10)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.3.19 Occupational Safety Assessment (VCS, 3.19; CCB, G3.12)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.4 Management Capacity

2.4.1 Project Governance Structures (CCB, G4.1)

The project is managed by the proponent Organica Consultoria LTDA, under the direction of Rémi Denecheau, who conducts the overall coordination of the project. His responsibilities include coordinating data management, marketing carbon credits, and drafting the project's design, implementation and monitoring documents.

The main entities involved in the project governance are:

- Organica Consultoria LTDA: Project Proponent, overall coordination, carbon accounting, monitoring, VCS/CCB compliance
- Comunidade São Tomé do Mocambo: Community engagement, stakeholder liaison, local monitoring support
- Urupolpas Comércio de Produtos Alimentí LTDA cios Ltda: Local implementation partner for field operations, forest inventories, FPIC processes, and community engagement, under the administration of Rémi Denecheau.

Governance structure: Organica Consultoria LTDA (Project Proponent – overall coordination, VCS/CCB compliance, financial management, benefit-sharing administration) → Urupolpas (local field operations, community liaison, logistical support in Nhamundá/Parintins region) → Community Advisory Committee (Comunidade São Tomé do Mocambo representatives, landowner representatives, Agrofrut Cooperative) → Technical Partners (GIS/remote sensing: John Klefesson; forest inventory: field team; legal: dedicated legal counsel). A governance structure diagram will be included as a figure in the final PD version.

Table 28. Activities and responsibilities of the organizations involved in the project

Entity	Responsibilities
Organica Consultoria LTDA	Project coordination, carbon accounting, methodology application, monitoring plan, VCS/CCB compliance, VVB liaison, credit commercialization, financial management
Comunidade São Tomé do Mocambo	Community engagement, stakeholder consultations, local monitoring, patrol coordination, NTFP activities, grievance reception
Technical partners: GIS/remote sensing (John Klefesson), forestry engineers, biodiversity specialists	Remote sensing analysis, forest inventory, biodiversity assessment, GIS mapping, carbon stock estimation
Land regularization: CDRU pathway – (SIGEF, INCRA coordination)	SIGEF certification, CDRU proceedings, property documentation, SECT/INCRA liaison

2.4.2 Required Technical Skills (VCS, 3.19; CCB, G4.2)

To better support the implementation of the Marcondes Project, Organica Consultoria LTDA and its team possess the following key skills and expertise:

- REDD+ methodology expertise (VM0007 v1.8) - carbon accounting, baseline modeling, leakage estimation, ex-ante ER quantification
- Remote sensing and GIS analysis - satellite imagery interpretation, land-use change detection, deforestation monitoring
- Forest inventory - plot design, tree measurement, biomass estimation, allometric equations
- Biodiversity assessment - fauna and flora surveys, species identification, HCV assessment
- Socioeconomic baseline assessment - community surveys, livelihood analysis, stakeholder mapping
- Legal expertise - Brazilian environmental law, land tenure, carbon credit legislation
- Community engagement - participatory methods, FPIC processes, benefit-sharing design
- Financial management - project budgeting, carbon credit revenue management, benefit distribution

2.4.3 Management Team Experience (VCS, 3.19; CCB, G4.2)

Rémi Denecheau - Project Director / CEO, Organica Consultoria LTDA

Over 20 years of experience connecting Amazon communities to international markets. Engineering background (UTC Compiègne), MBA in Carbon Credits (Universidade Focus, Brazil, 2025). Founder of RDV Productions (France, 2004), Organica Consultoria Ambiental (Brazil, 2016), and Botanik Source (Belgium, 2020). Core expertise in REDD+ carbon project development (VM0007), organic and Fair-Trade certification, Amazonian non-timber forest products, and industrial processing. Holder of a yerba mate patent (INPI, 2017–2019). Managed international cooperation programs (DEG/KfW, SEQUA, ADA Austria). Long-standing relationships with ribeirinho communities in Urucará and Nhamundá.

The project technical team is the multidisciplinary team that developed and operated the similar Project activities, providing continuity and proven expertise:

- Hector Monteiro — Forest Engineer: Forest inventory design, biomass estimation, allometric analysis
- Katherine Oliveira — Community Training and Engagement Coordinator
- Davidson do Canto — Biologist: Biodiversity surveys, fauna and flora inventories, species monitoring

- Hendrew Nunes de Souza — Biodiversity Manager: HCV assessment, threatened species monitoring
- Douglas Martins — GIS Analyst: Remote sensing, land-use change detection, deforestation monitoring
- Odiélio Nascimento — Climate and Environmental Data Analyst: Climate data collection, meteorological analysis
- Roberto Kwengwe — Marketing and Communications Specialist
- Sandro Martins — Funding and Regularization Coordinator: Land tenure, CDRU, CAR, SIGEF processes
- Daniel Vale — Finance and Administrative Analyst: Project budgeting, financial reporting
- Regiane Dias — Land Management Analyst: Property records, cartographic analysis
- Marcio Freitas — Agronomic and Certification Technician: Organic certification, field operations

2.4.4 Project Management Partnerships and Team Development (VCS, 3.19; CCB, G4.2)

The project builds on partnerships established through the, leveraging existing relationships with technical service providers, legal advisors, and community organizations in the Amazonas region.

Key partnerships include:

- Comunidade São Tomé do Mocambo community-level implementation and engagement
- Technical team partnership: Forest inventory and carbon stock assessment conducted by qualified forestry engineers under the supervision of Organica Consultoria LTDA, with field support from Urupolpas and local community members trained in inventory techniques.
- Land regularization team: A dedicated team with land regularization specialists managing CDRU applications, SIGEF registration, and INCRA/SECT coordination for all 36 properties.
- Legal advisors: Dedicated legal counsel for contract management (carbon credit agreements), land tenure issues, environmental compliance (IPAAM/SEMA), and corporate governance across the Kanopy Partners group structure.

Team development activities include capacity building for community monitors, technical training for field staff, and knowledge transfer from the similar project experience.

2.4.5 Financial Health of Implementing Organization(s) (CCB, G4.3)

Organica Consultoria LTDA is a legally constituted company in Brazil with the financial capacity to implement the project. The organization has demonstrated financial viability through the

successful development of the similar REDD+ APD Project and through its ongoing commercial activities in Amazonian products.

Evidence of financial health will be provided to the VVB during validation, including: audited financial statements of Organica Consultoria LTDA, bank references, and evidence of the proponent's capacity to sustain project operations through the carbon credit revenue cycle. The proponent's track record with the similar project development demonstrates financial and operational viability.

2.4.6 Avoidance of Corruption and Other Unethical Behavior (VCS, 3.19; CCB, G4.3)

The Project Proponent is committed to conducting all project activities in accordance with applicable anti-corruption laws, ethical standards, and best international practices. All activities are implemented in compliance with:

Brazilian Anti-Corruption Law No. 12.846/2013

Relevant provisions of the Brazilian Criminal Code concerning corruption, fraud, and misuse of resources

Ethical conduct requirements under the Verified Carbon Standard (VCS) Program

A zero-tolerance policy is strictly enforced against corruption, bribery, embezzlement, fraud, favoritism, cronyism, nepotism, extortion, and collusion. To ensure transparency, accountability, and ethical conduct throughout project implementation, the following measures are implemented:

Code of Conduct and Compliance Policies: A comprehensive Code of Conduct and compliance framework has been established, outlining ethical standards and behavioral expectations for all project participants, including team members, contractors, suppliers, and partners. These policies explicitly prohibit corrupt or unethical practices and provide clear guidance on acceptable conduct.

Transparent Financial Management: All financial transactions related to project activities are recorded, documented, and maintained in transparent financial management systems to ensure traceability and accountability.

Competitive Procurement Procedures: Procurement of goods and services follows competitive and transparent processes to avoid conflicts of interest and ensure fair participation of suppliers and service providers.

Segregation of Duties: Financial management responsibilities are clearly separated among personnel to minimize the risk of fraud or misuse of funds.

Anti-Corruption Training and Awareness: Regular training sessions and awareness programs are conducted to educate project staff, contractors, and stakeholders on the prevention of corruption

and unethical behavior. These programs cover types of corruption, legal implications, reporting mechanisms, and consequences of violations, promoting a culture of integrity and accountability.

Grievance and Whistleblower Protection: A grievance redress mechanism is established to allow stakeholders to report concerns, including suspected corruption or unethical behavior. Reports may be submitted confidentially, and whistleblowers are protected from retaliation.

Internal Monitoring and Reviews: Regular internal reviews and compliance checks are conducted to evaluate financial management systems, procurement procedures, and operational practices to ensure adherence to applicable laws, standards, and project policies.

All benefit-sharing payments are properly documented, traceable, and transparently recorded, and the methodology for distributing benefits is clearly communicated to all project participants and stakeholders.

2.4.7 Commercially Sensitive Information (VCS, 3.5.2 – 3.5.4; CCB Rules, 3.5.13 – 3.5.14)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5 Legal Status and Property Rights

2.5.1 National and Local Laws (VCS, 3.1, 3.6, 3.7, 3.14, 3.18, 3.19; CCB, G5.6)

The project complies with all applicable Brazilian labor and worker protection legislation, including:

- Consolidação das Leis do Trabalho (CLT – Decree-Law No. 5.452/1943): Comprehensive labor law covering employment contracts, working hours, wages, and employee protections.
- Federal Constitution of 1988 (Articles 6–11): Fundamental social and labor rights.
- Statute of the Child and Adolescent (Law No. 8.069/1990): Prohibits child labor (under 14) and regulates apprenticeship (14–16).
- Law No. 10.803/2003: Slavery-like labor conditions the project explicitly prohibits forced labor.
- Normas Regulamentadoras (NRs): Occupational safety standards, particularly NR-6 (PPE), NR-21 (open-air work), NR-31 (forestry and agriculture).
- Law No. 8.213/1991: Social security and occupational accident coverage.
- ILO Conventions ratified by Brazil: Including C029 (Forced Labour), C087 (Freedom of Association), C098 (Right to Organize), C100 (Equal Remuneration), C111 (Discrimination), C138 (Minimum Age), C182 (Worst Forms of Child Labour).

All project workers receive fair compensation, safe working conditions, and access to the grievance mechanism. No child labor or forced labor is permitted in any project activity.

2.5.2 Relevant Laws and Regulations Related to Worker's Rights (VCS, 3.18.2; CCB, G3.11)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.3 Human Rights (VCS, 3.19)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.4 Indigenous Peoples and Cultural Heritage (VCS, 3.18, 3.19)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.5 Statutory and Customary Property Rights (VCS, 3.18, 3.19; CCB, G5.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.6 Recognition of Property Rights (VCS, 3.7, 3.18, 3.19; CCB, G5.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.7 Free, Prior and Informed Consent (VCS, 3.18; CCB, G5.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.8 Benefit Sharing Mechanisms (VCS, 3.18, 3.19;)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.9 Property Rights Protection (VCS, 3.18, 3.19; CCB, G5.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.10 Illegal Activity Identification (VCS, 3.19; CCB, G5.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.11 Ongoing Disputes (VCS, 3.18, 3.19; CCB, G5.5)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.12 Approvals (CCB, G5.7)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.5.13 Double Counting and Participation under Other GHG Programs (VCS, 3.23; CCB G5.9)

2.5.13.1 No Double Issuance

Is the project receiving or seeking credit for reductions and removals from a project activity under another GHG program, or any other form of community, social, or biodiversity unit or credit?

☐ Yes ☒ No

2.5.13.2 Registration in Other GHG Programs

Has the project registered under any other GHG programs?

☐ Yes ☒ No

Is the project active under the other program?

☐ Yes ☒ No

2.5.13.3 Projects Rejected by Other GHG Programs

Has the project been rejected by any other GHG programs?

☐ Yes ☒ No

2.5.14 Double Claiming, Other Forms of Credit, and Scope 3 Emissions (VCS, 3.24)

2.5.14.1 No Double Claiming with Emissions Trading Programs or Binding Emission Limits

Are project reductions and removals or project activities also included in an emissions trading program or binding emission limit? See the *VCS Program Definitions* for definitions of emissions trading program and binding emission limit.

☐ Yes ☒ No

2.5.14.2 No Double Claiming with Other Forms of Environmental Credit

Has the project activity sought, received, or is planning to receive credit from another GHG-related environmental credit system? See the *VCS Program Definitions* for definition of GHG-related environmental credit system.

☐ Yes ☒ No

2.5.14.3 Supply Chain (Scope 3) Emissions

Do the project activities affect the emissions footprint of any product(s) (goods or services) that are part of a supply chain?

☐ Yes ☒ No

If yes:

Is the project proponent(s) or authorized representative a buyer or seller of the product(s) (goods or services) that are part of a supply chain?

☐ Yes ☒ No

Has the project proponent(s) or authorized representative posted a public statement on their website saying, "Carbon credits may be issued through Verified Carbon Standard project [project ID] for the greenhouse gas emission reductions or removals associated with [project proponent or authorized representative organization name(s)] [name of product(s) whose emissions footprint is changed by the project activities]."?

☐ Yes ☒ No

2.6 Additional Information Relevant to the Project

2.6.1 Leakage Management (VCS, 3.11, 3.15)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

2.6.2 Further Information

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3 CLIMATE

3.1 Application of Methodology

3.1.1 Title and Reference of Methodology (VCS, 3.1)

The Marcondes REDD+ project applies the Climate, Communities and Biodiversity (CCB) and Verified Carbon Standard (VCS) with the intention of reducing CO₂ emissions from planned (APD) deforestation compared to baseline levels. As required by VM0007 v1.7, the project area consists of contiguous, discrete areas covered by forest that meet the definition of eligible forest, which would be an area that has been forested for at least 10 years prior to the project start date. Methodology VM0007 applies to project activities that prevent conversion of forest to non-forest and of native grassland to a non-native state.

Table 30. Methodologies, modules, and tools applied

Type	Reference ID	Title	Version
Applied Methodology	VM0007	REDD+ Methodology Framework (REDD+MF) (Avoided Planned Deforestation)	1.8
Module	VMD0001	Estimation of carbon stocks in the above- and below-ground biomass in live trees and non-tree pools	1.2
Module	VMD0002	Estimation of carbon stocks in the dead wood pool	1.1
Module	VMD0003	Estimation of carbon stocks in the litter pool	1.1
Module	VMD0005	Estimation of carbon stocks in the soil organic carbon (SOC) pool	1.1
Module	VMD0006	Estimation of baseline carbon stock changes and GHG emissions from planned deforestation (BL-PL)	1.4
Module	VMD0009	Estimation of emissions from activity shifting for avoiding planned deforestation/forest degradation and avoiding planned wetland degradation (LK-ASP)	1.3
Module	VMD0011	Estimation of emissions from market leakage (LK-ME)	1.2

Module	VMD0015	Methods for monitoring of greenhouse gas emissions and removals (M-REDD)	2.3
Module	VMD0016	Methods for stratification of the project area (X-STR)	1.3
Module	VMD0017	Estimation of uncertainty for REDD project activities (X-UNC)	2.2
Tool	VT0001	Tool for the Demonstration and Assessment of Additionality in VCS-AFOLU Project Activities	3.0
Tool	—	AFOLU Non-Permanence Risk Tool	4.2

3.1.2 Applicability of Methodology (VCS, 3.1)

The applicability conditions of the VM0007 methodology and its associated modules are detailed in the table below.

Table 31. Applicability conditions and justification of conformance

Reference	Applicability Condition	Justification of Conformance
VM0007 v1.8	1) Land in the project area has qualified as forest (following the definition used by the VCS; in addition, see Section 5.1.2) for at least the 10 years prior to the project start date. Mangrove forests are excluded from any tree height requirement in a forest definition, as they consist of 95 percent mangrove species, which often do not reach the same height as other tree species. Mangroves occupy contiguous areas and their functioning as a forest is independent of tree height.	MapBiomass Collection 10 and PRODES/INPE data confirm continuous forest cover for all 36 properties throughout the historical reference period (2013–2023). Annual LULC maps demonstrate Dense Ombrophilous Forest classification without interruption.
	2) Where land within the project area is peatland or tidal wetlands and emissions from the SOC pool are deemed significant, the relevant WRC modules (see Table 3) are applied alongside other relevant modules.	There are no peat soils and tidal wetlands present in the Marcondes REDD+ Project Area.
	3) Baseline deforestation in the project area falls within either of the following categories:	Deforestation in the project area is legally authorized under the Brazilian Forest Code (Law 12.651/2012), Article 12, which permits clearing of up to 20% of rural

	a) Unplanned deforestation (VCS category AUDef) b) Planned deforestation (VCS category APDef)	properties in the Legal Amazon. The APDef category is applicable.
	REDD activity types are not applicable under the following condition: 4) Leakage prevention activities include: a) Flooding agricultural lands to increase production (e.g., rice paddies); and/or b) Intensifying livestock production through use of feed-lots and/or manure lagoons.	Leakage mitigation activities under the project do not implement flooded agriculture or livestock intensification through feedlots or manure lagoons.
	Avoiding planned deforestation activities are applicable under the following condition: 7) Where conversion of forest lands to a deforested condition is legally permitted	All 36 project properties are classified as forest. In the baseline scenario, landowners would exercise their legal right to deforest up to 20% of each property. Deforestation is authorized under the Brazilian Forest Code (Law 12.651/2012). All 36 property owners have filed ASV applications with IPAAM. SIGEF and CAR registrations confirm legal property boundaries and forest code compliance.
VMD0006 v1.4	The module is applicable for estimating the baseline emissions on forest lands (usually privately or government owned) that are legally authorized and documented to be converted to non-forest land.	The Marcondes project reduces emissions from planned deforestation (APD) on forest land (privately owned) within the Legal Amazon that are legally authorized and documented to be converted to non-forest land.
VMD0001 v1.2	The module allows for the ex-ante estimation of carbon stocks in tree and non- tree above and below ground biomass in the baseline scenario (for both pre- and post-deforestation stocks) and in the project case and for the ex-post estimation of the change in	This module is applicable to all forest phyto physiognomies and age classes. The inclusion of the above ground tree biomass pool as part of the project boundary is mandatory according to the REDD-MF module.

	carbon stocks in tree above and below ground biomass in the project case.	Carbon stocks will be estimated through forest inventory plots using allometric equations.
VMD0005 v1.2	This module is applicable to all cases where wood is harvested for conversion to wood products for commercial markets, for all forest types and age classes.	This module is applicable to all cases where timber is harvested for conversion into timber products for commercial markets, for all forest Phyto physiognomies and age classes. This module is applicable in the baseline, as the wood products pool is included as part of the project boundary, as per applicability criteria in the REDD-MF framework module, specifically: ▪ Timber harvesting occurs before or during the deforestation process, and the timber is destined for commercial markets. ▪ The wood product pool is determined to be significant (using T GIS).
VMD0009 v1.3	The module is applicable for estimating the leakage emissions due to activity shifting from forest lands that are legally authorized and documented to be converted to non-forest land, including activity shifting to forested wetland that is drained or degraded as a consequence of project implementation. The module is also applicable for estimating the leakage emissions due to activity shifting from non-forested wetlands that are legally authorized and documented to be converted and degraded. Under these situations, displacement of baseline activities can be controlled and measured directly by monitoring the baseline deforestation or wetland degradation agents or class of agents. This tool must be used for projects in areas where planned deforestation happens on forested wetlands, regardless of the absence of wetland within the project boundaries.	The module is mandatory if the BL-PL Module is used to define the baseline, and the applicability conditions in the BL-PL Module must be met in full.

VMD0011 v1.2	This module is applicable for calculating market-effects leakage from projects that are anticipated to reduce levels of wood harvest substantially and permanently. When project activities result in reductions in wood harvest, it is likely that production could shift to other areas of the country to compensate for the reduction, including activity shifting to forested peatland that is drained as a consequence of project implementation. This tool shall be used in countries where wood harvest happens on forested peatland regardless of the absence of peatland within the project boundary. As referenced in the Framework (REDD MF), the module is mandatory where: The deforestation process involves harvesting timber for commercial markets. Baseline is calculated using BL-DFW and firewood or charcoal is harvested for commercial markets. In all other circumstances, the module should not be used.	The module is mandatory when the deforestation process involves the extraction of timber for commercial markets. The module is applicable to the Marcondes Project as project activities are expected to substantially reduce and prevent wood harvesting within the project boundary through the protection and conservation of native forest areas. Such reductions in timber supply could potentially lead to market-effects leakage if wood production shifts to other regions within Brazil to meet market demand. The project therefore assesses the potential for market-effects leakage.
VMD0013 v1.3	This module is applicable to REDD project activities with emissions from biomass burning and REDD-WRC project activities with emissions from biomass and/or peat burning. This module is also applicable to RWE and ARR-RWE project activities with emissions from peat burning.	In the baseline scenario, fire is used to clear land, resulting in emissions of CO₂, N₂O and CH₄. When used in the baseline, accounting must occur both under the baseline and in the project scenario and both in the project area and in the leakage belt. Where fires occur ex-post in areas that coincide with deforested or degraded areas in the baseline, the module should be used to account for greenhouse gas emissions.
VMD0016 v1.3	This module provides guidance on how to stratify the project area into discrete, relatively homogeneous units to improve the accuracy and precision of	Strata are only used for forest classes under deforestation pressure and are the same in the case of the baseline and project scenario.

	carbon stock and carbon stock change estimates.	The post-deforestation (conversion) scenario is not stratified, instead the average of the carbon stock values for post-deforestation land uses is applied observing the guidelines of Module BL-PL.
VMD0017 v2.2	This module is mandatory when using methodology REDD+ MF. It is applicable for estimating the uncertainty of estimates of emissions and removals of CO₂-e generated from REDD and WRC project activities. The module focuses on the following sources of uncertainty: ▪ Determination of rates of deforestation and degradation ▪ Uncertainty associated with estimation of stocks in carbon pools and changes in carbon stocks ▪ Uncertainty associated with estimation of peat emissions ▪ Uncertainty in assessment of project emissions Where an uncertainty value is not known or cannot be simply calculated, a project must justify that it is using an indisputably conservative number and an uncertainty of 0% may be used for this component.	This module is mandatory when using the REDD+ MF methodology. The project therefore quantifies uncertainties related to the determination of deforestation and degradation rates, estimation of carbon stock levels and changes in carbon pools, and assessment of project emissions.
VT0001 v3.0	▪ AFOLU activities the same or similar to the proposed project activity on the land within the proposed project boundary, performed with or without registration as a VCS AFOLU project, will not lead to a violation of any applicable law, even if the law is not enforced. ▪ The use of this tool to determine additionality requires that the baseline methodology provide a stepwise approach that justifies the determination of the most plausible baseline scenario. Project proponents proposing new baseline methodologies should ensure	The planned project activities within the forest area consist of avoiding deforestation and conserving forest resources and are fully compliant with all applicable laws and regulations in Brazil. As stated in Section 2.5, the project is in compliance with all relevant laws, statutes and regulatory frameworks. The determination of the baseline scenario and additionality follows the stepwise procedures outlined in the applicable methodology.

	consistency between the determination of a baseline scenario and the determination of the additionality of a project activity.	
--	--	--

3.1.3 Project Boundary (VCS, 3.12)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.1.4 Baseline Scenario (VCS, 3.13)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.1.5 Additionality (VCS, 3.14)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.1.5.1 Regulatory Surplus (VCS, 3.14)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.1.5.2 Additionality Methods (VCS, 3.14)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.1.6 Methodology Deviations (VCS, 3.20)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.2 Quantification of Estimated GHG Emission Reductions and Removals

3.2.1 Baseline Emissions (VCS, 3.15)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.2.2 Project Emissions (VCS, 3.15)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.2.3 Leakage Emissions (VCS 2.5, 3.2, 3.6, 3.15, 4.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.2.4 Estimated GHG Emission Reductions and Carbon Dioxide Removals (VCS, 3.15, 4.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.3 Monitoring

3.3.1 Data and Parameters Available at Validation (VCS, 3.16)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.3.2 Data and Parameters Monitored (VCS, 3.16)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.3.3 Monitoring Plan (VCS, 3.16, 3.20)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.3.4 Dissemination of Monitoring Plan and Results (VCS, 3.18; CCB, CL4.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

3.4 Optional Criterion: Climate Change Adaptation Benefits

3.4.1 Regional Climate Change Scenarios (CCB, GL1.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

3.4.2 Climate Change Impacts (CCB, GL1.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

3.4.3 Measures Needed and Designed for Adaptation (CCB, GL1.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4 COMMUNITY

4.1 Without-Project Community Scenario

4.1.1 Descriptions of Communities at Project Start (CCB, CM1.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.1.2 Interactions between Communities and Community Groups (VCS, 3.19; CCB, CM1.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.1.3 High Conservation Values (CCB, CM1.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.1.4 Without-Project Scenario: Community (CCB, CM1.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.2 Net Positive Community Impacts

4.2.1 Expected Community Impacts (CCB, CM2.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.2.2 Negative Community Impact Mitigation (VCS, 3.19; CCB, CM2.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.2.3 Net Positive Community Well-Being (VCS, 3.19; CCB, CM2.3, GL1.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.2.4 High Conservation Values Protected (CCB, CM2.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.3 Other Stakeholder Impacts

4.3.1 Impacts on Other Stakeholders (VCS, 3.18, 3.19; CCB, CM3.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.3.2 Mitigation of Negative Impacts on Other Stakeholders (VCS, 3.18, 3.19; CCB, CM3.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.3.3 Net Impacts on Other Stakeholders (VCS, 3.18, 3.19; CCB, CM3.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.4 Community Impact Monitoring

4.4.1 Community Monitoring Plan (CCB, CM4.1, CM4.2, GL1.4, GL2.2, GL2.3, GL2.5)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.4.2 Monitoring Plan Dissemination (CCB, CM4.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0. The relevant information will be provided during the validation stage of the project.

4.5 Optional Criterion: Exceptional Community Benefits

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.1 Exceptional Community Criteria (CCB, GL2.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.2 Short-term and Long-term Community Benefits (CCB, GL2.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.3 Community Participation Risks (CCB, GL2.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.4 Marginalized and/or Vulnerable Community Groups (CCB, GL2.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.5 Net Impacts on Women (CCB, GL2.5)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.6 Benefit Sharing Mechanisms (CCB, GL2.6)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.7 Benefits, Costs, and Risks Communication (VCS, 3.18; CCB, GL2.7)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.8 Governance and Implementation Structures (CCB, GL2.8)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

4.5.9 Smallholders/Community Members Capacity Development (CCB, GL2.9)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5 BIODIVERSITY

5.1 Without-Project Biodiversity Scenario

5.1.1 Existing Conditions (VCS, 3.19; CCB, B1.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.1.2 High Conservation Values (CCB, B1.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.1.3 Without-project Scenario: Biodiversity (CCB, B1.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2 Net Positive Biodiversity Impacts

5.2.1 Expected Biodiversity Changes (VCS, 3.19; CCB, B2.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2.2 Mitigation Measures (VCS, 3.19; CCB, B2.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2.3 Net Positive Biodiversity Impacts (CCB, B2.2, GL1.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2.4 High Conservation Values Protected (CCB, B2.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2.5 Species Used (VCS, 3.19; CCB, B2.5, B2.6)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2.6 Invasive Species (VCS, 3.19; CCB, B2.5)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2.7 GMO Exclusion (CCB, B2.7)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2.8 Inputs Justification (VCS, 3.19; CCB, B2.8)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.2.9 Waste Products (VCS, 3.19; CCB, B2.9)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.3 Offsite Biodiversity Impacts

5.3.1 Negative Offsite Biodiversity Impacts (CCB, B3.1) and Mitigation Measures (CCB, B3.2)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.3.2 Net Offsite Biodiversity Benefits (VCS, 3.19; CCB, B3.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.4 Biodiversity Impact Monitoring

5.4.1 Biodiversity Monitoring Plan (CCB, B4.1, B4.2, GL1.4, GL3.4)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.4.2 Biodiversity Monitoring Plan Dissemination (CCB, B4.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.5 Optional Criterion: Exceptional Biodiversity Benefits

5.5.1 High Biodiversity Conservation Priority Status (CCB, GL3.1)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

5.5.2 Trigger Species Population Trends (CCB, GL3.2, GL3.3)

This section is not required at the Under Development stage in accordance with Section 3.1.6 of the Verra Registration and Issuance Process v5.0.

APPENDIX 1: STAKEHOLDER DESCRIPTION TABLE

Stakeholder	Rights, interest, and overall relevance to the project

APPENDIX 2: PROJECT ACTIVITIES AND THEORY OF CHANGE TABLE

Use this appendix, if applicable, to identify project activities and fulfill the requirements of Section 0 above. This is an example of just one method of representing the theory of change. Results chains/flow diagrams are another effective way to represent the theory of change. Modify the table, if necessary, to suit the project activities, or delete if not used.

Activity description	Expected climate, community, and/or biodiversity			Relevance to project's objectives
	Outputs (short term)	Outcomes (medium term)	Impacts (long term)	

APPENDIX 3: PROJECT RISKS TABLE

Use this appendix to identify and summarize the project risks and fulfill the requirements of Sections 2.3.6, 2.3.17, 2.5, and 5.2.1– 5.2.9, above. Where no risk is identified, write ‘No risk identified’ and provide justification in the third column. Add rows as needed.

	Identified risk(s)	Potential impact of risk on stakeholders, ecosystem health, and biodiversity	Mitigation or preventative measure(s) taken
Natural and human induced risks to stakeholders’ wellbeing			
Risks to stakeholder participation			
Working conditions			
Safety of women and girls			
Safety of minority and marginalized groups, including children			
Pollutants (air, noise, discharges to water, generation of waste, and release of hazardous materials and chemical pesticides and fertilizers)			
Discrimination			

Sexual harassment			
Equal pay for equal work			
Gender equity in labor and work			
Forced labor ¹³			
Child labor			
Human trafficking			
Recognition of, respect of, and promotion of the rights to IPs, LCs and customary rights holders			
Preserving and protecting cultural heritage			
Protecting and preserving property rights, customary rights, or protecting legal or customary tenure/access rights to territories, property, and resources, including collective and/or conflicting rights			

¹³ The identified risks and commensurate mitigation or preventative measure(s) for forced labor, child labor, and human trafficking, must be inclusive of staff and contracted workers employed by third parties.

Impacts on biodiversity and ecosystems			
Soil degradation and soil erosion			
Water consumption and stress			
Habitats (and areas needed for habitat connectivity) for rare, threatened, and endangered species			
Areas needed for habitat connectivity			
Invasive species			
Ecosystem conversion			
[Additional risk identified]			

APPENDIX 4: COMMERCIALY SENSITIVE INFORMATION

Section	Information	Justification
Not Applicable	Not Applicable	Not Applicable

APPENDIX X: <TITLE OF APPENDIX>

Use appendices for supporting information. Delete this appendix (title and instructions) where no appendix is required.
