

Kenya Project Evidence Summary

Prepared for Quick Check second-pass validation

Purpose. This synthetic evidence note is designed as a second manual check for Quick Check. It uses a different methodology string, a different reporting window format, and a denser structure than the Malawi test file while still presenting direct claim-relevant facts in embedded text.

Key facts likely relevant to claim matching

Field	Value
Country	Kenya
Project type	Agroforestry and community reforestation activity
Methodology	Verra VM0050 v1.1
Reporting period	1 April 2024 - 31 March 2025
Project area	Makueni County and Kitui County, Kenya
Primary claim	The monitoring report covers the full reporting period and the boundary description matches the map

Methodology statement

The project applies Verra VM0050 v1.1 to quantify removals and monitor agroforestry implementation in eligible community plots in Kenya. All monitoring, leakage review, and boundary reporting in this evidence package are prepared with reference to Verra VM0050 requirements and project implementation records.

Reporting period coverage

This monitoring report covers the full reporting period from 1 April 2024 through 31 March 2025 with no gaps in the reporting window. Source records include monthly field logs, quarterly survival assessments, nursery issuance sheets, and annual reconciliation summaries.

Project boundary and implementation

The mapped project area covers Makueni County and Kitui County in Kenya. Polygon maps, field parcel registers, and GPS-tagged site inspection records confirm that implementation activity occurred inside the mapped project boundary throughout the reporting period.

Baseline and justification

The baseline scenario assumes continued low tree cover, limited assisted regeneration, and continued degradation pressure on the same land parcels. Baseline justification is supported by enrollment surveys, land-use observations, and pre-implementation field notes collected in the same counties.

Monitoring evidence relevant to claim matching

Quarterly monitoring records document seedling survival checks, farmer participation logs, and plot-level maintenance visits during the full reporting period. The evidence supports the claim that the reporting period is complete and that the boundary description matches the mapped project area used in project

monitoring.

Evidence matrix

Evidence item	What it supports
Parcel register and county maps	Boundary description matches mapped project area
Quarterly survival assessments	Monitoring occurred during the full reporting period
GPS-tagged field inspections	Activity locations align with mapped project area
Annual reconciliation summary	No reporting-period gap in the monitoring package

Extract-friendly excerpt

- Methodology: Verra VM0050 v1.1.
- Country: Kenya.
- Project area: Makueni County and Kitui County.
- Reporting period: 1 April 2024 - 31 March 2025.
- Claim support: The monitoring report covers the full reporting period and the boundary description matches the mapped project area.
