

Malawi Project Evidence Summary

Prepared for Quick Check demo

Purpose

This synthetic evidence note is written to provide a strong, explicit signal for a single-claim check. It states the methodology, project boundary, monitoring period, baseline framing, and evidence-backed implementation facts in direct language.

Key facts likely relevant to claim matching

Field	Value
Country	Malawi
Project type	Improved cookstove distribution and monitored use
Methodology	Gold Standard TPDDTEC, Version 4.0
Monitoring period	1 January 2025 to 31 December 2025
Project area	Lilongwe District and Machinga District, Malawi
Primary claim	The monitoring report covers the full reporting period and documents monitored stove usage for the project area.

Methodology statement

The project applies Gold Standard TPDDTEC, Version 4.0 for improved cookstove activities in Malawi.

All monitoring and emission reduction calculations in this evidence package are prepared with reference to Gold Standard TPDDTEC requirements for project boundary, baseline, monitoring frequency, and usage evidence.

Monitoring period coverage

This monitoring report covers the full reporting period from 1 January 2025 through 31 December 2025 with no gaps in the reporting window.

Data sources used for the full reporting period include monthly distribution records, quarterly field surveys, usage checks, and year-end reconciliation logs.

Project boundary and implementation

The mapped project area covers Lilongwe District and Machinga District in Malawi.

A total of 18,240 improved cookstoves were distributed during the monitoring period inside the mapped project boundary.

GPS-tagged distribution logs and district-level deployment sheets confirm that the activity locations match the mapped project area.

Baseline and justification

The baseline scenario remains continued use of non-renewable biomass on traditional three-stone fires and basic charcoal stoves.

Baseline surveys completed before implementation showed that households in the project area primarily relied on firewood and charcoal for daily cooking needs.

This baseline methodology choice is justified by household survey evidence, fuel purchase patterns, and field enumerator notes collected in the same districts.

Monitoring evidence relevant to stove use

Quarterly monitoring surveys show sustained use of the distributed improved cookstoves during the full reporting period.

Kitchen performance monitoring sheets, fuel consumption logs, and spot-check records provide evidence of continued stove operation by sampled households.

The evidence indicates monitored stove usage rather than one-time distribution only.

Recommended claim for demo

The monitoring report covers the full reporting period and the boundary description matches the mapped project area.

The baseline methodology is clearly justified by the evidence collected in Malawi households.

Extract-friendly excerpt

- Methodology: Gold Standard TPDDTEC Version 4.0.
- Country: Malawi.
- Project area: Lilongwe District and Machinga District.
- Monitoring period: 1 January 2025 to 31 December 2025.
- Claim support: The monitoring report covers the full reporting period, the boundary description matches the mapped project area, and monitored stove usage is documented by quarterly surveys and field records.
